[12823] GAM925 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM925 target RNA, herein designated GAM TARGET RNA. GAM925 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12824] GAM925 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM925 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM925 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM925 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM925 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12825] The complementary binding of GAM925 RNA, herein designated GAM RNA, to target binding sites on GAM925 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM925 target RNA, herein designated GAM TARGET RNA, into GAM925 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12826] It is appreciated that GAM925 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM925 target genes. The mRNA of each one of this plurality of GAM925 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM925 RNA, herein designated GAM RNA, and which when bound by GAM925 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM925 target proteins.

[12827] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM925 gene, herein designated GAM GENE, on one or more GAM925 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12828] It is yet further appreciated that specific functions, and accordingly utilities, of GAM925 correlate with, and may be deduced from, the identity of the target genes which GAM925 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12829] Nucleotide sequences of the GAM925 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM925 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM925 are further described hereinbelow with reference to Table 1.

[12830] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM925 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12831] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 926 (GAM926) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12832] GAM926 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM926 was detected is described hereinabove with reference to Figs. 2-8.

[12833] GAM926 gene, herein designated GAM GENE, and GAM926 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12834] GAM926 gene, herein designated GAM GENE, encodes a GAM926 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM926 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM926 precursor RNA is designated SEQ ID:903, and is provided hereinbelow with reference to the sequence listing part.

[12835] GAM926 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12836] An enzyme complex designated DICER COMPLEX, dices the GAM926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM926 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM926 RNA is designated SEQ ID:3505, and is provided hereinbelow with reference to the sequence listing part.

[12837] GAM926 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM926 target RNA, herein designated GAM TARGET RNA. GAM926 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12838] GAM926 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM926 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM926 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM926 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM926 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12839] The complementary binding of GAM926 RNA, herein designated GAM RNA, to target binding sites on GAM926 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM926 target RNA, herein designated GAM TARGET RNA, into GAM926 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12840] It is appreciated that GAM926 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM926 target genes. The mRNA of each one of this plurality of GAM926 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM926 RNA, herein designated GAM RNA, and which when bound by GAM926 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM926 target proteins.

[12841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM926 gene, herein designated GAM GENE, on one or more GAM926 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12842] It is yet further appreciated that specific functions, and accordingly utilities, of GAM926 correlate with, and may be deduced from, the identity of the target genes which GAM926 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12843] Nucleotide sequences of the GAM926 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM926 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM926 are further described hereinbelow with reference to Table 1.

[12844] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM926 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12845] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 927 (GAM927) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12846] GAM927 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM927 was detected is described hereinabove with reference to Figs. 2-8.

[12847] GAM927 gene, herein designated GAM GENE, and GAM927 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12848] GAM927 gene, herein designated GAM GENE, encodes a GAM927 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM927 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM927 precursor RNA is designated SEQ ID:904, and is provided hereinbelow with reference to the sequence listing part.

[12849] GAM927 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12850] An enzyme complex designated DICER COMPLEX, dices the GAM927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM927 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM927 RNA is designated SEQ ID:3506, and is provided hereinbelow with reference to the sequence listing part.

[12851] GAM927 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM927 target RNA, herein designated GAM TARGET RNA. GAM927 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12852] GAM927 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM927 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM927 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM927 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM927 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12853] The complementary binding of GAM927 RNA, herein designated GAM RNA, to target binding sites on GAM927 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM927 target RNA, herein designated GAM TARGET RNA, into GAM927 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12854] It is appreciated that GAM927 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM927 target genes. The mRNA of each one of this plurality of GAM927 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM927 RNA, herein designated GAM RNA, and which when bound by GAM927 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM927 target proteins.

[12855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM927 gene, herein designated GAM GENE, on one or more

GAM927 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12856] It is yet further appreciated that specific functions, and accordingly utilities, of GAM927 correlate with, and may be deduced from, the identity of the target genes which GAM927 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12857] Nucleotide sequences of the GAM927 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM927 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM927 are further described hereinbelow with reference to Table 1.

[12858] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM927 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12859] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 928 (GAM928) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12860] GAM928 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM928 was detected is described hereinabove with reference to Figs. 2-8.

[12861] GAM928 gene, herein designated GAM GENE, and GAM928 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12862] GAM928 gene, herein designated GAM GENE, encodes a GAM928 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM928 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM928 precursor RNA is designated SEQ ID:905, and is provided hereinbelow with reference to the sequence listing part.

[12863] GAM928 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM928 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12864] An enzyme complex designated DICER COMPLEX, dices the GAM928 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM928 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM928 RNA is designated SEQ ID:3507, and is provided hereinbelow with reference to the sequence listing part.

[12865] GAM928 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM928 target RNA, herein designated GAM TARGET RNA. GAM928 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12866] GAM928 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM928 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM928 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM928 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM928 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12867] The complementary binding of GAM928 RNA, herein designated GAM RNA, to target binding sites on GAM928 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM928 target RNA, herein designated GAM TARGET RNA, into GAM928 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12868] It is appreciated that GAM928 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM928 target genes. The mRNA of each one of this plurality of GAM928 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM928 RNA, herein designated GAM RNA, and which when bound by GAM928 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM928 target proteins.

[12869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM928 gene, herein designated GAM GENE, on one or more GAM928 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12870] It is yet further appreciated that specific functions, and accordingly utilities, of GAM928 correlate with, and may be deduced from, the identity of the target genes which GAM928 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12871] Nucleotide sequences of the GAM928 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM928 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM928 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM928 are further described hereinbelow with reference to Table 1.

[12872] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM928 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12873] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 929 (GAM929) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12874] GAM929 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM929 was detected is described hereinabove with reference to Figs. 2-8.

[12875] GAM929 gene, herein designated GAM GENE, and GAM929 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12876] GAM929 gene, herein designated GAM GENE, encodes a GAM929 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM929 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM929 precursor RNA is designated SEQ ID:906, and is provided hereinbelow with reference to the sequence listing part.

[12877] GAM929 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM929 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12878] An enzyme complex designated DICER COMPLEX, dices the GAM929 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM929 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM929 RNA is designated SEQ ID:3508, and is provided hereinbelow with reference to the sequence listing part.

[12879] GAM929 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM929 target RNA, herein designated GAM TARGET RNA. GAM929 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12880] GAM929 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM929

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM929 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM929 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM929 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12881] The complementary binding of GAM929 RNA, herein designated GAM RNA, to target binding sites on GAM929 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM929 target RNA, herein designated GAM TARGET RNA, into GAM929 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12882] It is appreciated that GAM929 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM929 target genes. The mRNA of each one of this plurality of GAM929 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM929 RNA, herein designated GAM RNA, and which when bound by GAM929 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM929 target proteins.

[12883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM929 gene, herein designated GAM GENE, on one or more GAM929 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12884] It is yet further appreciated that specific functions, and accordingly utilities, of GAM929 correlate with, and may be deduced from, the identity of the target genes which GAM929 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12885] Nucleotide sequences of the GAM929 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM929 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM929 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM929 are further described hereinbelow with

reference to Table 1.

[12886] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM929 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12887] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 930 (GAM930) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12888] GAM930 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM930 was detected is described hereinabove with reference to Figs. 2-8.

[12889] GAM930 gene, herein designated GAM GENE, and GAM930 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12890] GAM930 gene, herein designated GAM GENE, encodes a GAM930 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM930 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM930 precursor RNA is designated SEQ ID:907, and is provided

hereinbelow with reference to the sequence listing part.

[12891] GAM930 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM930 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12892] An enzyme complex designated DICER COMPLEX, dices the GAM930 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM930 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM930 RNA is designated SEQ ID:3509, and is provided hereinbelow with reference to the sequence listing part.

[12893] GAM930 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM930 target RNA, herein designated GAM TARGET RNA. GAM930 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[12894] GAM930 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM930 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM930 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM930 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM930 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12895] The complementary binding of GAM930 RNA, herein designated GAM RNA, to target binding sites on GAM930 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM930 target RNA, herein designated GAM TARGET RNA, into GAM930 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12896] It is appreciated that GAM930 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM930 target genes. The mRNA of each one of this plurality of GAM930 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM930 RNA, herein designated GAM RNA, and which when bound by GAM930 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM930 target proteins.

[12897] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM930 gene, herein designated GAM GENE, on one or more GAM930 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12898] It is yet further appreciated that specific functions, and accordingly utilities, of GAM930 correlate with, and may be deduced from, the identity of the target genes which GAM930 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12899] Nucleotide sequences of the GAM930 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM930 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM930 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM930 are further described hereinbelow with reference to Table 1.

[12900] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM930 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12901] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 931 (GAM931) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12902] GAM931 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM931 was detected is described hereinabove with reference to Figs. 2-8.

[12903] GAM931 gene, herein designated GAM GENE, and GAM931 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12904] GAM931 gene, herein designated GAM GENE, encodes a GAM931 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM931 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM931 precursor RNA is designated SEQ ID:908, and is provided hereinbelow with reference to the sequence listing part.

[12905] GAM931 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12906] An enzyme complex designated DICER COMPLEX, dices the GAM931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM931 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM931 RNA is designated SEQ ID:3510, and is provided hereinbelow with reference to the sequence listing part.

[12907] GAM931 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM931 target RNA, herein designated

GAM TARGET RNA. GAM931 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12908] GAM931 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM931 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM931 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM931 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM931 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12909] The complementary binding of GAM931 RNA, herein designated GAM RNA, to target binding sites on GAM931 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM931 target RNA, herein designated GAM

TARGET RNA, into GAM931 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12910] It is appreciated that GAM931 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM931 target genes. The mRNA of each one of this plurality of GAM931 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM931 RNA, herein designated GAM RNA, and which when bound by GAM931 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM931 target proteins.

[12911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM931 gene, herein designated GAM GENE, on one or more GAM931 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12912] It is yet further appreciated that specific functions, and accordingly utilities, of GAM931 correlate with, and may be deduced from, the identity of the target

genes which GAM931 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12913] Nucleotide sequences of the GAM931 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM931 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM931 are further described hereinbelow with reference to Table 1.

[12914] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM931 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12915] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 932 (GAM932) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12916] GAM932 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM932 was detected is described hereinabove with reference to Figs. 2-8.

[12917] GAM932 gene, herein designated GAM GENE, and GAM932 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[12918] GAM932 gene, herein designated GAM GENE, encodes a GAM932 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM932 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM932 precursor RNA is designated SEQ ID:909, and is provided hereinbelow with reference to the sequence listing part.

[12919] GAM932 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12920] An enzyme complex designated DICER COMPLEX, dices the GAM932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM932 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM932 RNA is designated SEQ ID:3512, and is provided

hereinbelow with reference to the sequence listing part.

[12921] GAM932 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM932 target RNA, herein designated GAM TARGET RNA. GAM932 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12922] GAM932 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM932 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM932 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM932 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM932 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12923] The complementary binding of GAM932 RNA, herein designated GAM RNA, to target binding sites on GAM932 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM932 target RNA, herein designated GAM TARGET RNA, into GAM932 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12924] It is appreciated that GAM932 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM932 target genes. The mRNA of each one of this plurality of GAM932 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM932 RNA, herein designated GAM RNA, and which when bound by GAM932 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM932 target proteins.

[12925] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM932 gene, herein designated GAM GENE, on one or more GAM932 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12926] It is yet further appreciated that specific functions, and accordingly utilities, of GAM932 correlate with, and may be deduced from, the identity of the target genes which GAM932 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12927] Nucleotide sequences of the GAM932 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM932 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM932 are further described hereinbelow with reference to Table 1.

[12928] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM932 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12929] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 933 (GAM933) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12930] GAM933 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM933 was detected is

described hereinabove with reference to Figs. 2-8.

[12931] GAM933 gene, herein designated GAM GENE, and GAM933 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12932] GAM933 gene, herein designated GAM GENE, encodes a GAM933 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM933 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM933 precursor RNA is designated SEQ ID:910, and is provided hereinbelow with reference to the sequence listing part.

[12933] GAM933 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12934] An enzyme complex designated DICER COMPLEX, dices the GAM933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM933 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM933 RNA is designated SEQ ID:3511, and is provided hereinbelow with reference to the sequence listing part.

[12935] GAM933 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM933 target RNA, herein designated GAM TARGET RNA. GAM933 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12936] GAM933 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM933 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM933 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM933 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM933 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12937] The complementary binding of GAM933 RNA, herein designated GAM RNA, to target binding sites on GAM933 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM933 target RNA, herein designated GAM TARGET RNA, into GAM933 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12938] It is appreciated that GAM933 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM933 target genes. The mRNA of each one of this plurality of GAM933 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM933 RNA, herein designated GAM RNA, and which when bound by GAM933 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM933 target proteins.

[12939] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM933 gene, herein designated GAM GENE, on one or more GAM933 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12940] It is yet further appreciated that specific functions, and accordingly utilities, of GAM933 correlate with, and may be deduced from, the identity of the target genes which GAM933 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12941] Nucleotide sequences of the GAM933 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM933 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM933 are further described hereinbelow with reference to Table 1.

[12942] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM933 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12943] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 934 (GAM934) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12944] GAM934 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM934 was detected is described hereinabove with reference to Figs. 2-8.

[12945] GAM934 gene, herein designated GAM GENE, and GAM934 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12946] GAM934 gene, herein designated GAM GENE, encodes a GAM934 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM934 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM934 precursor RNA is designated SEQ ID:911, and is provided hereinbelow with reference to the sequence listing part.

[12947] GAM934 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12948] An enzyme complex designated DICER COMPLEX, dices the GAM934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM934 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM934 RNA is designated SEQ ID:3514, and is provided hereinbelow with reference to the sequence listing part.

[12949] GAM934 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM934 target RNA, herein designated GAM TARGET RNA. GAM934 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12950] GAM934 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM934 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM934 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM934 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM934 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12951] The complementary binding of GAM934 RNA, herein designated GAM RNA, to target binding sites on GAM934 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM934 target RNA, herein designated GAM TARGET RNA, into GAM934 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12952] It is appreciated that GAM934 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM934 target genes. The mRNA of each one of this plurality of GAM934 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM934 RNA, herein designated GAM RNA, and which when bound by GAM934 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM934 target proteins.

[12953] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM934 gene, herein designated GAM GENE, on one or more GAM934 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12954] It is yet further appreciated that specific functions, and accordingly utilities, of GAM934 correlate with, and may be deduced from, the identity of the target genes which GAM934 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12955] Nucleotide sequences of the GAM934 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM934 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM934 are further described hereinbelow with reference to Table 1.

[12956] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM934 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12957] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 935 (GAM935) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12958] GAM935 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM935 was detected is described hereinabove with reference to Figs. 2-8.

[12959] GAM935 gene, herein designated GAM GENE, and GAM935 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12960] GAM935 gene, herein designated GAM GENE, encodes a GAM935 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM935 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM935 precursor RNA is designated SEQ ID:912, and is provided hereinbelow with reference to the sequence listing part.

[12961] GAM935 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM935 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12962] An enzyme complex designated DICER COMPLEX, dices the GAM935 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM935 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM935 RNA is designated SEQ ID:3513, and is provided hereinbelow with reference to the sequence listing part.

[12963] GAM935 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM935 target RNA, herein designated GAM TARGET RNA. GAM935 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12964] GAM935 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM935 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM935 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM935 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM935 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12965] The complementary binding of GAM935 RNA, herein designated GAM RNA, to target binding sites on GAM935 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM935 target RNA, herein designated GAM TARGET RNA, into GAM935 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12966] It is appreciated that GAM935 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM935 target genes. The mRNA of each one of this plurality of GAM935 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM935 RNA, herein designated GAM RNA, and which when bound by GAM935 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM935 target proteins.

[12967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM935 gene, herein designated GAM GENE, on one or more

GAM935 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12968] It is yet further appreciated that specific functions, and accordingly utilities, of GAM935 correlate with, and may be deduced from, the identity of the target genes which GAM935 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12969] Nucleotide sequences of the GAM935 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM935 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM935 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM935 are further described hereinbelow with reference to Table 1.

[12970] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM935 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12971] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 936 (GAM936) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12972] GAM936 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM936 was detected is described hereinabove with reference to Figs. 2-8.

[12973] GAM936 gene, herein designated GAM GENE, and GAM936 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12974] GAM936 gene, herein designated GAM GENE, encodes a GAM936 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM936 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM936 precursor RNA is designated SEQ ID:913, and is provided hereinbelow with reference to the sequence listing part.

[12975] GAM936 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM936 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12976] An enzyme complex designated DICER COMPLEX, dices the GAM936 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM936 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM936 RNA is designated SEQ ID:3515, and is provided hereinbelow with reference to the sequence listing part.

[12977] GAM936 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM936 target RNA, herein designated GAM TARGET RNA. GAM936 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12978] GAM936 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM936 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM936 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM936 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM936 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12979] The complementary binding of GAM936 RNA, herein designated GAM RNA, to target binding sites on GAM936 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM936 target RNA, herein designated GAM TARGET RNA, into GAM936 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12980] It is appreciated that GAM936 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM936 target genes. The mRNA of each one of this plurality of GAM936 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM936 RNA, herein designated GAM RNA, and which when bound by GAM936 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM936 target proteins.

[12981] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM936 gene, herein designated GAM GENE, on one or more GAM936 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12982] It is yet further appreciated that specific functions, and accordingly utilities, of GAM936 correlate with, and may be deduced from, the identity of the target genes which GAM936 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12983] Nucleotide sequences of the GAM936 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM936 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM936 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM936 are further described hereinbelow with reference to Table 1.

[12984] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM936 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12985] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 937 (GAM937) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12986] GAM937 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM937 was detected is described hereinabove with reference to Figs. 2-8.

[12987] GAM937 gene, herein designated GAM GENE, and GAM937 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12988] GAM937 gene, herein designated GAM GENE, encodes a GAM937 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM937 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM937 precursor RNA is designated SEQ ID:914, and is provided hereinbelow with reference to the sequence listing part.

[12989] GAM937 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM937 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12990] An enzyme complex designated DICER COMPLEX, dices the GAM937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM937 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM937 RNA is designated SEQ ID:3516, and is provided hereinbelow with reference to the sequence listing part.

[12991] GAM937 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM937 target RNA, herein designated GAM TARGET RNA. GAM937 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12992] GAM937 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM937

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM937 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM937 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM937 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12993] The complementary binding of GAM937 RNA, herein designated GAM RNA, to target binding sites on GAM937 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM937 target RNA, herein designated GAM TARGET RNA, into GAM937 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12994] It is appreciated that GAM937 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM937 target genes. The mRNA of each one of this plurality of GAM937 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM937 RNA, herein designated GAM RNA, and which when bound by GAM937 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM937 target proteins.

[12995] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM937 gene, herein designated GAM GENE, on one or more GAM937 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12996] It is yet further appreciated that specific functions, and accordingly utilities, of GAM937 correlate with, and may be deduced from, the identity of the target genes which GAM937 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12997] Nucleotide sequences of the GAM937 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM937 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM937 are further described hereinbelow with

reference to Table 1.

[12998] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM937 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12999] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 938 (GAM938) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13000] GAM938 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM938 was detected is described hereinabove with reference to Figs. 2-8.

[13001] GAM938 gene, herein designated GAM GENE, and GAM938 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13002] GAM938 gene, herein designated GAM GENE, encodes a GAM938 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM938 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM938 precursor RNA is designated SEQ ID:915, and is provided

hereinbelow with reference to the sequence listing part.

[13003] GAM938 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13004] An enzyme complex designated DICER COMPLEX, dices the GAM938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM938 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM938 RNA is designated SEQ ID:3517, and is provided hereinbelow with reference to the sequence listing part.

[13005] GAM938 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM938 target RNA, herein designated GAM TARGET RNA. GAM938 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[13006] GAM938 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM938 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM938 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM938 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM938 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13007] The complementary binding of GAM938 RNA, herein designated GAM RNA, to target binding sites on GAM938 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM938 target RNA, herein designated GAM TARGET RNA, into GAM938 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13008] It is appreciated that GAM938 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM938 target genes. The mRNA of each one of this plurality of GAM938 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM938 RNA, herein designated GAM RNA, and which when bound by GAM938 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM938 target proteins.

[13009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM938 gene, herein designated GAM GENE, on one or more GAM938 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13010] It is yet further appreciated that specific functions, and accordingly utilities, of GAM938 correlate with, and may be deduced from, the identity of the target genes which GAM938 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13011] Nucleotide sequences of the GAM938 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM938 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM938 are further described hereinbelow with reference to Table 1.

[13012] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM938 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13013] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 939 (GAM939) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13014] GAM939 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM939 was detected is described hereinabove with reference to Figs. 2-8.

[13015] GAM939 gene, herein designated GAM GENE, and GAM939 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13016] GAM939 gene, herein designated GAM GENE, encodes a GAM939 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM939 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM939 precursor RNA is designated SEQ ID:916, and is provided hereinbelow with reference to the sequence listing part.

[13017] GAM939 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13018] An enzyme complex designated DICER COMPLEX, dices the GAM939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM939 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM939 RNA is designated SEQ ID:3518, and is provided hereinbelow with reference to the sequence listing part.

[13019] GAM939 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM939 target RNA, herein designated

GAM TARGET RNA. GAM939 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13020] GAM939 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM939 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM939 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM939 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM939 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13021] The complementary binding of GAM939 RNA, herein designated GAM RNA, to target binding sites on GAM939 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM939 target RNA, herein designated GAM

TARGET RNA, into GAM939 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13022] It is appreciated that GAM939 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM939 target genes. The mRNA of each one of this plurality of GAM939 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM939 RNA, herein designated GAM RNA, and which when bound by GAM939 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM939 target proteins.

[13023] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM939 gene, herein designated GAM GENE, on one or more GAM939 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13024] It is yet further appreciated that specific functions, and accordingly utilities, of GAM939 correlate with, and may be deduced from, the identity of the target

genes which GAM939 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13025] Nucleotide sequences of the GAM939 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM939 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM939 are further described hereinbelow with reference to Table 1.

[13026] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM939 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13027] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 940 (GAM940) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13028] GAM940 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM940 was detected is described hereinabove with reference to Figs. 2-8.

[13029] GAM940 gene, herein designated GAM GENE, and GAM940 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13030] GAM940 gene, herein designated GAM GENE, encodes a GAM940 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM940 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM940 precursor RNA is designated SEQ ID:917, and is provided hereinbelow with reference to the sequence listing part.

[13031] GAM940 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM940 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13032] An enzyme complex designated DICER COMPLEX, dices the GAM940 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM940 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM940 RNA is designated SEQ ID:3519, and is provided

hereinbelow with reference to the sequence listing part.

[13033] GAM940 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM940 target RNA, herein designated GAM TARGET RNA. GAM940 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13034] GAM940 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM940 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM940 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM940 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM940 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13035] The complementary binding of GAM940 RNA, herein designated GAM RNA, to target binding sites on GAM940 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM940 target RNA, herein designated GAM TARGET RNA, into GAM940 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13036] It is appreciated that GAM940 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM940 target genes. The mRNA of each one of this plurality of GAM940 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM940 RNA, herein designated GAM RNA, and which when bound by GAM940 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM940 target proteins.

[13037] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM940 gene, herein designated GAM GENE, on one or more GAM940 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13038] It is yet further appreciated that specific functions, and accordingly utilities, of GAM940 correlate with, and may be deduced from, the identity of the target genes which GAM940 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13039] Nucleotide sequences of the GAM940 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM940 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM940 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM940 are further described hereinbelow with reference to Table 1.

[13040] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM940 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13041] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 941 (GAM941) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13042] GAM941 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM941 was detected is

described hereinabove with reference to Figs. 2-8.

[13043] GAM941 gene, herein designated GAM GENE, and GAM941 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13044] GAM941 gene, herein designated GAM GENE, encodes a GAM941 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM941 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM941 precursor RNA is designated SEQ ID:918, and is provided hereinbelow with reference to the sequence listing part.

[13045] GAM941 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13046] An enzyme complex designated DICER COMPLEX, dices the GAM941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM941 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM941 RNA is designated SEQ ID:3520, and is provided hereinbelow with reference to the sequence listing part.

[13047] GAM941 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM941 target RNA, herein designated GAM TARGET RNA. GAM941 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13048] GAM941 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM941 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM941 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM941 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM941 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13049] The complementary binding of GAM941 RNA, herein designated GAM RNA, to target binding sites on GAM941 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM941 target RNA, herein designated GAM TARGET RNA, into GAM941 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13050] It is appreciated that GAM941 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM941 target genes. The mRNA of each one of this plurality of GAM941 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM941 RNA, herein designated GAM RNA, and which when bound by GAM941 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM941 target proteins.

[13051] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM941 gene, herein designated GAM GENE, on one or more GAM941 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13052] It is yet further appreciated that specific functions, and accordingly utilities, of GAM941 correlate with, and may be deduced from, the identity of the target genes which GAM941 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13053] Nucleotide sequences of the GAM941 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM941 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM941 are further described hereinbelow with reference to Table 1.

[13054] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM941 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13055] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 942 (GAM942) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13056] GAM942 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM942 was detected is described hereinabove with reference to Figs. 2-8.

[13057] GAM942 gene, herein designated GAM GENE, and GAM942 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13058] GAM942 gene, herein designated GAM GENE, encodes a GAM942 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM942 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM942 precursor RNA is designated SEQ ID:919, and is provided hereinbelow with reference to the sequence listing part.

[13059] GAM942 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13060] An enzyme complex designated DICER COMPLEX, dices the GAM942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM942 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM942 RNA is designated SEQ ID:3521, and is provided hereinbelow with reference to the sequence listing part.

[13061] GAM942 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM942 target RNA, herein designated GAM TARGET RNA. GAM942 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13062] GAM942 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM942 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM942 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM942 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM942 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13063] The complementary binding of GAM942 RNA, herein designated GAM RNA, to target binding sites on GAM942 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM942 target RNA, herein designated GAM TARGET RNA, into GAM942 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13064] It is appreciated that GAM942 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM942 target genes. The mRNA of each one of this plurality of GAM942 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM942 RNA, herein designated GAM RNA, and which when bound by GAM942 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM942 target proteins.

[13065] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM942 gene, herein designated GAM GENE, on one or more GAM942 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13066] It is yet further appreciated that specific functions, and accordingly utilities, of GAM942 correlate with, and may be deduced from, the identity of the target genes which GAM942 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13067] Nucleotide sequences of the GAM942 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM942 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM942 are further described hereinbelow with reference to Table 1.

[13068] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM942 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13069] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 943 (GAM943) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13070] GAM943 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM943 was detected is described hereinabove with reference to Figs. 2-8.

[13071] GAM943 gene, herein designated GAM GENE, and GAM943 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13072] GAM943 gene, herein designated GAM GENE, encodes a GAM943 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM943 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM943 precursor RNA is designated SEQ ID:920, and is provided hereinbelow with reference to the sequence listing part.

[13073] GAM943 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM943 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13074] An enzyme complex designated DICER COMPLEX, dices the GAM943 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM943 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM943 RNA is designated SEQ ID:3522, and is provided hereinbelow with reference to the sequence listing part.

[13075] GAM943 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM943 target RNA, herein designated GAM TARGET RNA. GAM943 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13076] GAM943 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM943 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM943 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM943 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM943 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13077] The complementary binding of GAM943 RNA, herein designated GAM RNA, to target binding sites on GAM943 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM943 target RNA, herein designated GAM TARGET RNA, into GAM943 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13078] It is appreciated that GAM943 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM943 target genes. The mRNA of each one of this plurality of GAM943 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM943 RNA, herein designated GAM RNA, and which when bound by GAM943 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM943 target proteins.

[13079] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM943 gene, herein designated GAM GENE, on one or more

GAM943 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13080] It is yet further appreciated that specific functions, and accordingly utilities, of GAM943 correlate with, and may be deduced from, the identity of the target genes which GAM943 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13081] Nucleotide sequences of the GAM943 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM943 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM943 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM943 are further described hereinbelow with reference to Table 1.

[13082] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM943 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13083] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 944 (GAM944) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13084] GAM944 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM944 was detected is described hereinabove with reference to Figs. 2-8.

[13085] GAM944 gene, herein designated GAM GENE, and GAM944 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13086] GAM944 gene, herein designated GAM GENE, encodes a GAM944 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM944 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM944 precursor RNA is designated SEQ ID:921, and is provided hereinbelow with reference to the sequence listing part.

[13087] GAM944 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM944 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13088] An enzyme complex designated DICER COMPLEX, dices the GAM944 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM944 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM944 RNA is designated SEQ ID:3523, and is provided hereinbelow with reference to the sequence listing part.

[13089] GAM944 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM944 target RNA, herein designated GAM TARGET RNA. GAM944 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13090] GAM944 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM944 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM944 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM944 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM944 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13091] The complementary binding of GAM944 RNA, herein designated GAM RNA, to target binding sites on GAM944 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM944 target RNA, herein designated GAM TARGET RNA, into GAM944 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13092] It is appreciated that GAM944 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM944 target genes. The mRNA of each one of this plurality of GAM944 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM944 RNA, herein designated GAM RNA, and which when bound by GAM944 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM944 target proteins.

[13093] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM944 gene, herein designated GAM GENE, on one or more GAM944 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13094] It is yet further appreciated that specific functions, and accordingly utilities, of GAM944 correlate with, and may be deduced from, the identity of the target genes which GAM944 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13095] Nucleotide sequences of the GAM944 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM944 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM944 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM944 are further described hereinbelow with reference to Table 1.

[13096] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM944 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13097] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 945 (GAM945) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13098] GAM945 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM945 was detected is described hereinabove with reference to Figs. 2-8.

[13099] GAM945 gene, herein designated GAM GENE, and GAM945 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13100] GAM945 gene, herein designated GAM GENE, encodes a GAM945 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM945 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM945 precursor RNA is designated SEQ ID:922, and is provided hereinbelow with reference to the sequence listing part.

[13101] GAM945 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM945 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13102] An enzyme complex designated DICER COMPLEX, dices the GAM945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM945 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM945 RNA is designated SEQ ID:3524, and is provided hereinbelow with reference to the sequence listing part.

[13103] GAM945 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM945 target RNA, herein designated GAM TARGET RNA. GAM945 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13104] GAM945 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM945

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM945 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM945 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM945 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13105] The complementary binding of GAM945 RNA, herein designated GAM RNA, to target binding sites on GAM945 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM945 target RNA, herein designated GAM TARGET RNA, into GAM945 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13106] It is appreciated that GAM945 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM945 target genes. The mRNA of each one of this plurality of GAM945 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM945 RNA, herein designated GAM RNA, and which when bound by GAM945 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM945 target proteins.

[13107] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM945 gene, herein designated GAM GENE, on one or more GAM945 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13108] It is yet further appreciated that specific functions, and accordingly utilities, of GAM945 correlate with, and may be deduced from, the identity of the target genes which GAM945 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13109] Nucleotide sequences of the GAM945 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM945 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM945 are further described hereinbelow with

reference to Table 1.

[13110] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM945 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13111] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 946 (GAM946) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13112] GAM946 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM946 was detected is described hereinabove with reference to Figs. 2-8.

[13113] GAM946 gene, herein designated GAM GENE, and GAM946 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13114] GAM946 gene, herein designated GAM GENE, encodes a GAM946 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM946 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM946 precursor RNA is designated SEQ ID:923, and is provided

hereinbelow with reference to the sequence listing part.

[13115] GAM946 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13116] An enzyme complex designated DICER COMPLEX, dices the GAM946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM946 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM946 RNA is designated SEQ ID:3525, and is provided hereinbelow with reference to the sequence listing part.

[13117] GAM946 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM946 target RNA, herein designated GAM TARGET RNA. GAM946 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[13118] GAM946 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM946 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM946 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM946 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM946 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13119] The complementary binding of GAM946 RNA, herein designated GAM RNA, to target binding sites on GAM946 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM946 target RNA, herein designated GAM TARGET RNA, into GAM946 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13120] It is appreciated that GAM946 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM946 target genes. The mRNA of each one of this plurality of GAM946 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM946 RNA, herein designated GAM RNA, and which when bound by GAM946 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM946 target proteins.

[13121] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM946 gene, herein designated GAM GENE, on one or more GAM946 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13122] It is yet further appreciated that specific functions, and accordingly utilities, of GAM946 correlate with, and may be deduced from, the identity of the target genes which GAM946 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13123] Nucleotide sequences of the GAM946 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM946 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM946 are further described hereinbelow with reference to Table 1.

[13124] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM946 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13125] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 947 (GAM947) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13126] GAM947 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM947 was detected is described hereinabove with reference to Figs. 2-8.

[13127] GAM947 gene, herein designated GAM GENE, and GAM947 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13128] GAM947 gene, herein designated GAM GENE, encodes a GAM947 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM947 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM947 precursor RNA is designated SEQ ID:924, and is provided hereinbelow with reference to the sequence listing part.

[13129] GAM947 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13130] An enzyme complex designated DICER COMPLEX, dices the GAM947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM947 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM947 RNA is designated SEQ ID:3526, and is provided hereinbelow with reference to the sequence listing part.

[13131] GAM947 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM947 target RNA, herein designated

GAM TARGET RNA. GAM947 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13132] GAM947 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM947 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM947 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM947 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM947 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13133] The complementary binding of GAM947 RNA, herein designated GAM RNA, to target binding sites on GAM947 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM947 target RNA, herein designated GAM

TARGET RNA, into GAM947 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13134] It is appreciated that GAM947 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM947 target genes. The mRNA of each one of this plurality of GAM947 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM947 RNA, herein designated GAM RNA, and which when bound by GAM947 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM947 target proteins.

[13135] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM947 gene, herein designated GAM GENE, on one or more GAM947 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13136] It is yet further appreciated that specific functions, and accordingly utilities, of GAM947 correlate with, and may be deduced from, the identity of the target

genes which GAM947 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13137] Nucleotide sequences of the GAM947 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM947 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM947 are further described hereinbelow with reference to Table 1.

[13138] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM947 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13139] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 948 (GAM948) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13140] GAM948 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM948 was detected is described hereinabove with reference to Figs. 2-8.

[13141] GAM948 gene, herein designated GAM GENE, and GAM948 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13142] GAM948 gene, herein designated GAM GENE, encodes a GAM948 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM948 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM948 precursor RNA is designated SEQ ID:925, and is provided hereinbelow with reference to the sequence listing part.

[13143] GAM948 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM948 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13144] An enzyme complex designated DICER COMPLEX, dices the GAM948 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM948 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM948 RNA is designated SEQ ID:3527, and is provided

hereinbelow with reference to the sequence listing part.

[13145] GAM948 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM948 target RNA, herein designated GAM TARGET RNA. GAM948 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13146] GAM948 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM948 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM948 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM948 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM948 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13147] The complementary binding of GAM948 RNA, herein designated GAM RNA, to target binding sites on GAM948 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM948 target RNA, herein designated GAM TARGET RNA, into GAM948 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13148] It is appreciated that GAM948 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM948 target genes. The mRNA of each one of this plurality of GAM948 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM948 RNA, herein designated GAM RNA, and which when bound by GAM948 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM948 target proteins.

[13149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM948 gene, herein designated GAM GENE, on one or more GAM948 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13150] It is yet further appreciated that specific functions, and accordingly utilities, of GAM948 correlate with, and may be deduced from, the identity of the target genes which GAM948 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13151] Nucleotide sequences of the GAM948 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM948 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM948 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM948 are further described hereinbelow with reference to Table 1.

[13152] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM948 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13153] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 949 (GAM949) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13154] GAM949 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM949 was detected is

described hereinabove with reference to Figs. 2-8.

[13155] GAM949 gene, herein designated GAM GENE, and GAM949 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13156] GAM949 gene, herein designated GAM GENE, encodes a GAM949 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM949 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM949 precursor RNA is designated SEQ ID:926, and is provided hereinbelow with reference to the sequence listing part.

[13157] GAM949 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM949 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13158] An enzyme complex designated DICER COMPLEX, dices the GAM949 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM949 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM949 RNA is designated SEQ ID:3528, and is provided hereinbelow with reference to the sequence listing part.

[13159] GAM949 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM949 target RNA, herein designated GAM TARGET RNA. GAM949 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13160] GAM949 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM949 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM949 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM949 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM949 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13161] The complementary binding of GAM949 RNA, herein designated GAM RNA, to target binding sites on GAM949 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM949 target RNA, herein designated GAM TARGET RNA, into GAM949 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13162] It is appreciated that GAM949 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM949 target genes. The mRNA of each one of this plurality of GAM949 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM949 RNA, herein designated GAM RNA, and which when bound by GAM949 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM949 target proteins.

[13163] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM949 gene, herein designated GAM GENE, on one or more GAM949 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13164] It is yet further appreciated that specific functions, and accordingly utilities, of GAM949 correlate with, and may be deduced from, the identity of the target genes which GAM949 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13165] Nucleotide sequences of the GAM949 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM949 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM949 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM949 are further described hereinbelow with reference to Table 1.

[13166] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM949 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13167] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 950 (GAM950) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13168] GAM950 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM950 was detected is described hereinabove with reference to Figs. 2-8.

[13169] GAM950 gene, herein designated GAM GENE, and GAM950 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13170] GAM950 gene, herein designated GAM GENE, encodes a GAM950 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM950 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM950 precursor RNA is designated SEQ ID:927, and is provided hereinbelow with reference to the sequence listing part.

[13171] GAM950 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13172] An enzyme complex designated DICER COMPLEX, dices the GAM950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM950 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM950 RNA is designated SEQ ID:3530, and is provided hereinbelow with reference to the sequence listing part.

[13173] GAM950 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM950 target RNA, herein designated GAM TARGET RNA. GAM950 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13174] GAM950 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM950 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM950 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM950 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM950 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13175] The complementary binding of GAM950 RNA, herein designated GAM RNA, to target binding sites on GAM950 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM950 target RNA, herein designated GAM TARGET RNA, into GAM950 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13176] It is appreciated that GAM950 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM950 target genes. The mRNA of each one of this plurality of GAM950 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM950 RNA, herein designated GAM RNA, and which when bound by GAM950 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM950 target proteins.

[13177] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM950 gene, herein designated GAM GENE, on one or more GAM950 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13178] It is yet further appreciated that specific functions, and accordingly utilities, of GAM950 correlate with, and may be deduced from, the identity of the target genes which GAM950 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13179] Nucleotide sequences of the GAM950 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM950 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM950 are further described hereinbelow with reference to Table 1.

[13180] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM950 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13181] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 951 (GAM951) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13182] GAM951 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM951 was detected is described hereinabove with reference to Figs. 2-8.

[13183] GAM951 gene, herein designated GAM GENE, and GAM951 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13184] GAM951 gene, herein designated GAM GENE, encodes a GAM951 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM951 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM951 precursor RNA is designated SEQ ID:928, and is provided hereinbelow with reference to the sequence listing part.

[13185] GAM951 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13186] An enzyme complex designated DICER COMPLEX, dices the GAM951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM951 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM951 RNA is designated SEQ ID:3529, and is provided hereinbelow with reference to the sequence listing part.

[13187] GAM951 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM951 target RNA, herein designated GAM TARGET RNA. GAM951 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13188] GAM951 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM951 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM951 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM951 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM951 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13189] The complementary binding of GAM951 RNA, herein designated GAM RNA, to target binding sites on GAM951 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM951 target RNA, herein designated GAM TARGET RNA, into GAM951 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13190] It is appreciated that GAM951 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM951 target genes. The mRNA of each one of this plurality of GAM951 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM951 RNA, herein designated GAM RNA, and which when bound by GAM951 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM951 target proteins.

[13191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM951 gene, herein designated GAM GENE, on one or more

GAM951 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13192] It is yet further appreciated that specific functions, and accordingly utilities, of GAM951 correlate with, and may be deduced from, the identity of the target genes which GAM951 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13193] Nucleotide sequences of the GAM951 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM951 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM951 are further described hereinbelow with reference to Table 1.

[13194] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM951 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13195] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 952 (GAM952) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13196] GAM952 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM952 was detected is described hereinabove with reference to Figs. 2-8.

[13197] GAM952 gene, herein designated GAM GENE, and GAM952 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13198] GAM952 gene, herein designated GAM GENE, encodes a GAM952 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM952 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM952 precursor RNA is designated SEQ ID:929, and is provided hereinbelow with reference to the sequence listing part.

[13199] GAM952 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM952 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13200] An enzyme complex designated DICER COMPLEX, dices the GAM952 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM952 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM952 RNA is designated SEQ ID:3531, and is provided hereinbelow with reference to the sequence listing part.

[13201] GAM952 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM952 target RNA, herein designated GAM TARGET RNA. GAM952 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13202] GAM952 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM952 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM952 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM952 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM952 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13203] The complementary binding of GAM952 RNA, herein designated GAM RNA, to target binding sites on GAM952 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM952 target RNA, herein designated GAM TARGET RNA, into GAM952 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13204] It is appreciated that GAM952 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM952 target genes. The mRNA of each one of this plurality of GAM952 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM952 RNA, herein designated GAM RNA, and which when bound by GAM952 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM952 target proteins.

[13205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM952 gene, herein designated GAM GENE, on one or more GAM952 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13206] It is yet further appreciated that specific functions, and accordingly utilities, of GAM952 correlate with, and may be deduced from, the identity of the target genes which GAM952 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13207] Nucleotide sequences of the GAM952 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM952 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM952 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM952 are further described hereinbelow with reference to Table 1.

[13208] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM952 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13209] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 953 (GAM953) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13210] GAM953 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM953 was detected is described hereinabove with reference to Figs. 2-8.

[13211] GAM953 gene, herein designated GAM GENE, and GAM953 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13212] GAM953 gene, herein designated GAM GENE, encodes a GAM953 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM953 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM953 precursor RNA is designated SEQ ID:930, and is provided hereinbelow with reference to the sequence listing part.

[13213] GAM953 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM953 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13214] An enzyme complex designated DICER COMPLEX, dices the GAM953 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM953 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM953 RNA is designated SEQ ID:3533, and is provided hereinbelow with reference to the sequence listing part.

[13215] GAM953 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM953 target RNA, herein designated GAM TARGET RNA. GAM953 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13216] GAM953 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM953

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM953 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM953 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM953 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13217] The complementary binding of GAM953 RNA, herein designated GAM RNA, to target binding sites on GAM953 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM953 target RNA, herein designated GAM TARGET RNA, into GAM953 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13218] It is appreciated that GAM953 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM953 target genes. The mRNA of each one of this plurality of GAM953 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM953 RNA, herein designated GAM RNA, and which when bound by GAM953 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM953 target proteins.

[13219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM953 gene, herein designated GAM GENE, on one or more GAM953 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13220] It is yet further appreciated that specific functions, and accordingly utilities, of GAM953 correlate with, and may be deduced from, the identity of the target genes which GAM953 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13221] Nucleotide sequences of the GAM953 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM953 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM953 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM953 are further described hereinbelow with

reference to Table 1.

[13222] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM953 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13223] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 954 (GAM954) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13224] GAM954 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM954 was detected is described hereinabove with reference to Figs. 2-8.

[13225] GAM954 gene, herein designated GAM GENE, and GAM954 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13226] GAM954 gene, herein designated GAM GENE, encodes a GAM954 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM954 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM954 precursor RNA is designated SEQ ID:931, and is provided

hereinbelow with reference to the sequence listing part.

[13227] GAM954 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13228] An enzyme complex designated DICER COMPLEX, dices the GAM954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM954 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM954 RNA is designated SEQ ID:3532, and is provided hereinbelow with reference to the sequence listing part.

[13229] GAM954 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM954 target RNA, herein designated GAM TARGET RNA. GAM954 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[13230] GAM954 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM954 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM954 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM954 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM954 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13231] The complementary binding of GAM954 RNA, herein designated GAM RNA, to target binding sites on GAM954 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM954 target RNA, herein designated GAM TARGET RNA, into GAM954 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13232] It is appreciated that GAM954 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM954 target genes. The mRNA of each one of this plurality of GAM954 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM954 RNA, herein designated GAM RNA, and which when bound by GAM954 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM954 target proteins.

[13233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM954 gene, herein designated GAM GENE, on one or more GAM954 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13234] It is yet further appreciated that specific functions, and accordingly utilities, of GAM954 correlate with, and may be deduced from, the identity of the target genes which GAM954 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13235] Nucleotide sequences of the GAM954 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM954 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM954 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM954 are further described hereinbelow with reference to Table 1.

[13236] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM954 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13237] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 955 (GAM955) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13238] GAM955 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM955 was detected is described hereinabove with reference to Figs. 2-8.

[13239] GAM955 gene, herein designated GAM GENE, and GAM955 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13240] GAM955 gene, herein designated GAM GENE, encodes a GAM955 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM955 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM955 precursor RNA is designated SEQ ID:932, and is provided hereinbelow with reference to the sequence listing part.

[13241] GAM955 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM955 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13242] An enzyme complex designated DICER COMPLEX, dices the GAM955 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM955 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM955 RNA is designated SEQ ID:3534, and is provided hereinbelow with reference to the sequence listing part.

[13243] GAM955 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM955 target RNA, herein designated

GAM TARGET RNA. GAM955 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13244] GAM955 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM955 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM955 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM955 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM955 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13245] The complementary binding of GAM955 RNA, herein designated GAM RNA, to target binding sites on GAM955 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM955 target RNA, herein designated GAM

TARGET RNA, into GAM955 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13246] It is appreciated that GAM955 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM955 target genes. The mRNA of each one of this plurality of GAM955 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM955 RNA, herein designated GAM RNA, and which when bound by GAM955 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM955 target proteins.

[13247] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM955 gene, herein designated GAM GENE, on one or more GAM955 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13248] It is yet further appreciated that specific functions, and accordingly utilities, of GAM955 correlate with, and may be deduced from, the identity of the target

genes which GAM955 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13249] Nucleotide sequences of the GAM955 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM955 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM955 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM955 are further described hereinbelow with reference to Table 1.

[13250] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM955 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13251] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 956 (GAM956) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13252] GAM956 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM956 was detected is described hereinabove with reference to Figs. 2-8.

[13253] GAM956 gene, herein designated GAM GENE, and GAM956 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13254] GAM956 gene, herein designated GAM GENE, encodes a GAM956 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM956 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM956 precursor RNA is designated SEQ ID:933, and is provided hereinbelow with reference to the sequence listing part.

[13255] GAM956 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13256] An enzyme complex designated DICER COMPLEX, dices the GAM956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM956 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM956 RNA is designated SEQ ID:3535, and is provided

hereinbelow with reference to the sequence listing part.

[13257] GAM956 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM956 target RNA, herein designated GAM TARGET RNA. GAM956 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13258] GAM956 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM956 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM956 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM956 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM956 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13259] The complementary binding of GAM956 RNA, herein designated GAM RNA, to target binding sites on GAM956 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM956 target RNA, herein designated GAM TARGET RNA, into GAM956 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13260] It is appreciated that GAM956 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM956 target genes. The mRNA of each one of this plurality of GAM956 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM956 RNA, herein designated GAM RNA, and which when bound by GAM956 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM956 target proteins.

[13261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM956 gene, herein designated GAM GENE, on one or more GAM956 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13262] It is yet further appreciated that specific functions, and accordingly utilities, of GAM956 correlate with, and may be deduced from, the identity of the target genes which GAM956 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13263] Nucleotide sequences of the GAM956 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM956 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM956 are further described hereinbelow with reference to Table 1.

[13264] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM956 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13265] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 957 (GAM957) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13266] GAM957 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM957 was detected is

described hereinabove with reference to Figs. 2-8.

[13267] GAM957 gene, herein designated GAM GENE, and GAM957 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13268] GAM957 gene, herein designated GAM GENE, encodes a GAM957 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM957 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM957 precursor RNA is designated SEQ ID:934, and is provided hereinbelow with reference to the sequence listing part.

[13269] GAM957 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13270] An enzyme complex designated DICER COMPLEX, dices the GAM957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM957 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM957 RNA is designated SEQ ID:3536, and is provided hereinbelow with reference to the sequence listing part.

[13271] GAM957 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM957 target RNA, herein designated GAM TARGET RNA. GAM957 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13272] GAM957 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM957 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM957 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM957 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM957 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13273] The complementary binding of GAM957 RNA, herein designated GAM RNA, to target binding sites on GAM957 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM957 target RNA, herein designated GAM TARGET RNA, into GAM957 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13274] It is appreciated that GAM957 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM957 target genes. The mRNA of each one of this plurality of GAM957 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM957 RNA, herein designated GAM RNA, and which when bound by GAM957 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM957 target proteins.

[13275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM957 gene, herein designated GAM GENE, on one or more GAM957 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13276] It is yet further appreciated that specific functions, and accordingly utilities, of GAM957 correlate with, and may be deduced from, the identity of the target genes which GAM957 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13277] Nucleotide sequences of the GAM957 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM957 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM957 are further described hereinbelow with reference to Table 1.

[13278] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM957 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13279] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 958 (GAM958) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13280] GAM958 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM958 was detected is

described hereinabove with reference to Figs. 2-8.

[13281] GAM958 gene, herein designated GAM GENE, and GAM958 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13282] GAM958 gene, herein designated GAM GENE, encodes a GAM958 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM958 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM958 precursor RNA is designated SEQ ID:935, and is provided hereinbelow with reference to the sequence listing part.

[13283] GAM958 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13284] An enzyme complex designated DICER COMPLEX, dices the GAM958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM958 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM958 RNA is designated SEQ ID:3537, and is provided hereinbelow with reference to the sequence listing part.

[13285] GAM958 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM958 target RNA, herein designated GAM TARGET RNA. GAM958 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13286] GAM958 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM958 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM958 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM958 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM958 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13287] The complementary binding of GAM958 RNA, herein designated GAM RNA, to target binding sites on GAM958 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM958 target RNA, herein designated GAM TARGET RNA, into GAM958 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13288] It is appreciated that GAM958 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM958 target genes. The mRNA of each one of this plurality of GAM958 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM958 RNA, herein designated GAM RNA, and which when bound by GAM958 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM958 target proteins.

[13289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM958 gene, herein designated GAM GENE, on one or more GAM958 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13290] It is yet further appreciated that specific functions, and accordingly utilities, of GAM958 correlate with, and may be deduced from, the identity of the target genes which GAM958 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13291] Nucleotide sequences of the GAM958 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM958 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM958 are further described hereinbelow with reference to Table 1.

[13292] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM958 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13293] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 959 (GAM959) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13294] GAM959 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM959 was detected is described hereinabove with reference to Figs. 2-8.

[13295] GAM959 gene, herein designated GAM GENE, and GAM959 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13296] GAM959 gene, herein designated GAM GENE, encodes a GAM959 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM959 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM959 precursor RNA is designated SEQ ID:936, and is provided hereinbelow with reference to the sequence listing part.

[13297] GAM959 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13298] An enzyme complex designated DICER COMPLEX, dices the GAM959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM959 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM959 RNA is designated SEQ ID:3538, and is provided hereinbelow with reference to the sequence listing part.

[13299] GAM959 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM959 target RNA, herein designated GAM TARGET RNA. GAM959 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13300] GAM959 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM959 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM959 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM959 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM959 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13301] The complementary binding of GAM959 RNA, herein designated GAM RNA, to target binding sites on GAM959 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM959 target RNA, herein designated GAM TARGET RNA, into GAM959 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13302] It is appreciated that GAM959 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM959 target genes. The mRNA of each one of this plurality of GAM959 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM959 RNA, herein designated GAM RNA, and which when bound by GAM959 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM959 target proteins.

[13303] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM959 gene, herein designated GAM GENE, on one or more GAM959 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13304] It is yet further appreciated that specific functions, and accordingly utilities, of GAM959 correlate with, and may be deduced from, the identity of the target genes which GAM959 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13305] Nucleotide sequences of the GAM959 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM959 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM959 are further described hereinbelow with reference to Table 1.

[13306] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM959 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13307] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 960 (GAM960) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13308] GAM960 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM960 was detected is described hereinabove with reference to Figs. 2-8.

[13309] GAM960 gene, herein designated GAM GENE, and GAM960 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13310] GAM960 gene, herein designated GAM GENE, encodes a GAM960 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM960 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM960 precursor RNA is designated SEQ ID:937, and is provided hereinbelow with reference to the sequence listing part.

[13311] GAM960 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM960 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13312] An enzyme complex designated DICER COMPLEX, dices the GAM960 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM960 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM960 RNA is designated SEQ ID:3539, and is provided hereinbelow with reference to the sequence listing part.

[13313] GAM960 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM960 target RNA, herein designated GAM TARGET RNA. GAM960 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13314] GAM960 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM960 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM960 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM960 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM960 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13315] The complementary binding of GAM960 RNA, herein designated GAM RNA, to target binding sites on GAM960 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM960 target RNA, herein designated GAM TARGET RNA, into GAM960 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13316] It is appreciated that GAM960 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM960 target genes. The mRNA of each one of this plurality of GAM960 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM960 RNA, herein designated GAM RNA, and which when bound by GAM960 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM960 target proteins.

[13317] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM960 gene, herein designated GAM GENE, on one or more

GAM960 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13318] It is yet further appreciated that specific functions, and accordingly utilities, of GAM960 correlate with, and may be deduced from, the identity of the target genes which GAM960 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13319] Nucleotide sequences of the GAM960 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM960 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM960 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM960 are further described hereinbelow with reference to Table 1.

[13320] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM960 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13321] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 961 (GAM961) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13322] GAM961 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM961 was detected is described hereinabove with reference to Figs. 2-8.

[13323] GAM961 gene, herein designated GAM GENE, and GAM961 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13324] GAM961 gene, herein designated GAM GENE, encodes a GAM961 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM961 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM961 precursor RNA is designated SEQ ID:938, and is provided hereinbelow with reference to the sequence listing part.

[13325] GAM961 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13326] An enzyme complex designated DICER COMPLEX, dices the GAM961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM961 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM961 RNA is designated SEQ ID:3540, and is provided hereinbelow with reference to the sequence listing part.

[13327] GAM961 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM961 target RNA, herein designated GAM TARGET RNA. GAM961 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13328] GAM961 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM961 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM961 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM961 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM961 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13329] The complementary binding of GAM961 RNA, herein designated GAM RNA, to target binding sites on GAM961 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM961 target RNA, herein designated GAM TARGET RNA, into GAM961 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13330] It is appreciated that GAM961 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM961 target genes. The mRNA of each one of this plurality of GAM961 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM961 RNA, herein designated GAM RNA, and which when bound by GAM961 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM961 target proteins.

[13331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM961 gene, herein designated GAM GENE, on one or more GAM961 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13332] It is yet further appreciated that specific functions, and accordingly utilities, of GAM961 correlate with, and may be deduced from, the identity of the target genes which GAM961 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13333] Nucleotide sequences of the GAM961 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM961 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM961 are further described hereinbelow with reference to Table 1.

[13334] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM961 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13335] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 962 (GAM962) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13336] GAM962 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM962 was detected is described hereinabove with reference to Figs. 2-8.

[13337] GAM962 gene, herein designated GAM GENE, and GAM962 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13338] GAM962 gene, herein designated GAM GENE, encodes a GAM962 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM962 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM962 precursor RNA is designated SEQ ID:939, and is provided hereinbelow with reference to the sequence listing part.

[13339] GAM962 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM962 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13340] An enzyme complex designated DICER COMPLEX, dices the GAM962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM962 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM962 RNA is designated SEQ ID:3541, and is provided hereinbelow with reference to the sequence listing part.

[13341] GAM962 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM962 target RNA, herein designated GAM TARGET RNA. GAM962 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13342] GAM962 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM962

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM962 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM962 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM962 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13343] The complementary binding of GAM962 RNA, herein designated GAM RNA, to target binding sites on GAM962 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM962 target RNA, herein designated GAM TARGET RNA, into GAM962 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13344] It is appreciated that GAM962 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM962 target genes. The mRNA of each one of this plurality of GAM962 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM962 RNA, herein designated GAM RNA, and which when bound by GAM962 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM962 target proteins.

[13345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM962 gene, herein designated GAM GENE, on one or more GAM962 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13346] It is yet further appreciated that specific functions, and accordingly utilities, of GAM962 correlate with, and may be deduced from, the identity of the target genes which GAM962 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13347] Nucleotide sequences of the GAM962 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM962 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM962 are further described hereinbelow with

reference to Table 1.

[13348] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM962 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13349] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 963 (GAM963) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13350] GAM963 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM963 was detected is described hereinabove with reference to Figs. 2-8.

[13351] GAM963 gene, herein designated GAM GENE, and GAM963 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13352] GAM963 gene, herein designated GAM GENE, encodes a GAM963 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM963 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM963 precursor RNA is designated SEQ ID:940, and is provided

hereinbelow with reference to the sequence listing part.

[13353] GAM963 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13354] An enzyme complex designated DICER COMPLEX, dices the GAM963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM963 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM963 RNA is designated SEQ ID:3542, and is provided hereinbelow with reference to the sequence listing part.

[13355] GAM963 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM963 target RNA, herein designated GAM TARGET RNA. GAM963 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[13356] GAM963 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM963 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM963 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM963 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM963 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13357] The complementary binding of GAM963 RNA, herein designated GAM RNA, to target binding sites on GAM963 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM963 target RNA, herein designated GAM TARGET RNA, into GAM963 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13358] It is appreciated that GAM963 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM963 target genes. The mRNA of each one of this plurality of GAM963 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM963 RNA, herein designated GAM RNA, and which when bound by GAM963 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM963 target proteins.

[13359] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM963 gene, herein designated GAM GENE, on one or more GAM963 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13360] It is yet further appreciated that specific functions, and accordingly utilities, of GAM963 correlate with, and may be deduced from, the identity of the target genes which GAM963 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13361] Nucleotide sequences of the GAM963 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM963 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM963 are further described hereinbelow with reference to Table 1.

[13362] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM963 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13363] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 964 (GAM964) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13364] GAM964 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM964 was detected is described hereinabove with reference to Figs. 2-8.

[13365] GAM964 gene, herein designated GAM GENE, and GAM964 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13366] GAM964 gene, herein designated GAM GENE, encodes a GAM964 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM964 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM964 precursor RNA is designated SEQ ID:941, and is provided hereinbelow with reference to the sequence listing part.

[13367] GAM964 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13368] An enzyme complex designated DICER COMPLEX, dices the GAM964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM964 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM964 RNA is designated SEQ ID:3543, and is provided hereinbelow with reference to the sequence listing part.

[13369] GAM964 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM964 target RNA, herein designated

GAM TARGET RNA. GAM964 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13370] GAM964 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM964 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM964 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM964 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM964 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13371] The complementary binding of GAM964 RNA, herein designated GAM RNA, to target binding sites on GAM964 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM964 target RNA, herein designated GAM

TARGET RNA, into GAM964 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13372] It is appreciated that GAM964 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM964 target genes. The mRNA of each one of this plurality of GAM964 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM964 RNA, herein designated GAM RNA, and which when bound by GAM964 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM964 target proteins.

[13373] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM964 gene, herein designated GAM GENE, on one or more GAM964 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13374] It is yet further appreciated that specific functions, and accordingly utilities, of GAM964 correlate with, and may be deduced from, the identity of the target

genes which GAM964 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13375] Nucleotide sequences of the GAM964 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM964 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM964 are further described hereinbelow with reference to Table 1.

[13376] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM964 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13377] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 965 (GAM965) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13378] GAM965 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM965 was detected is described hereinabove with reference to Figs. 2-8.

[13379] GAM965 gene, herein designated GAM GENE, and GAM965 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13380] GAM965 gene, herein designated GAM GENE, encodes a GAM965 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM965 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM965 precursor RNA is designated SEQ ID:942, and is provided hereinbelow with reference to the sequence listing part.

[13381] GAM965 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13382] An enzyme complex designated DICER COMPLEX, dices the GAM965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM965 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM965 RNA is designated SEQ ID:3544, and is provided

hereinbelow with reference to the sequence listing part.

[13383] GAM965 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM965 target RNA, herein designated GAM TARGET RNA. GAM965 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13384] GAM965 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM965 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM965 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM965 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM965 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13385] The complementary binding of GAM965 RNA, herein designated GAM RNA, to target binding sites on GAM965 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM965 target RNA, herein designated GAM TARGET RNA, into GAM965 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13386] It is appreciated that GAM965 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM965 target genes. The mRNA of each one of this plurality of GAM965 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM965 RNA, herein designated GAM RNA, and which when bound by GAM965 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM965 target proteins.

[13387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM965 gene, herein designated GAM GENE, on one or more GAM965 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13388] It is yet further appreciated that specific functions, and accordingly utilities, of GAM965 correlate with, and may be deduced from, the identity of the target genes which GAM965 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13389] Nucleotide sequences of the GAM965 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM965 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM965 are further described hereinbelow with reference to Table 1.

[13390] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM965 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13391] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 966 (GAM966) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13392] GAM966 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM966 was detected is

described hereinabove with reference to Figs. 2-8.

[13393] GAM966 gene, herein designated GAM GENE, and GAM966 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13394] GAM966 gene, herein designated GAM GENE, encodes a GAM966 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM966 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM966 precursor RNA is designated SEQ ID:943, and is provided hereinbelow with reference to the sequence listing part.

[13395] GAM966 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13396] An enzyme complex designated DICER COMPLEX, dices the GAM966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM966 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM966 RNA is designated SEQ ID:3545, and is provided hereinbelow with reference to the sequence listing part.

[13397] GAM966 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM966 target RNA, herein designated GAM TARGET RNA. GAM966 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13398] GAM966 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM966 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM966 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM966 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM966 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13399] The complementary binding of GAM966 RNA, herein designated GAM RNA, to target binding sites on GAM966 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM966 target RNA, herein designated GAM TARGET RNA, into GAM966 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13400] It is appreciated that GAM966 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM966 target genes. The mRNA of each one of this plurality of GAM966 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM966 RNA, herein designated GAM RNA, and which when bound by GAM966 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM966 target proteins.

[13401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM966 gene, herein designated GAM GENE, on one or more GAM966 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13402] It is yet further appreciated that specific functions, and accordingly utilities, of GAM966 correlate with, and may be deduced from, the identity of the target genes which GAM966 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13403] Nucleotide sequences of the GAM966 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM966 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM966 are further described hereinbelow with reference to Table 1.

[13404] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM966 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13405] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 967 (GAM967) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13406] GAM967 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM967 was detected is described hereinabove with reference to Figs. 2-8.

[13407] GAM967 gene, herein designated GAM GENE, and GAM967 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13408] GAM967 gene, herein designated GAM GENE, encodes a GAM967 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM967 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM967 precursor RNA is designated SEQ ID:944, and is provided hereinbelow with reference to the sequence listing part.

[13409] GAM967 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13410] An enzyme complex designated DICER COMPLEX, dices the GAM967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM967 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM967 RNA is designated SEQ ID:3546, and is provided hereinbelow with reference to the sequence listing part.

[13411] GAM967 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM967 target RNA, herein designated GAM TARGET RNA. GAM967 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13412] GAM967 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM967 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM967 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM967 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM967 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13413] The complementary binding of GAM967 RNA, herein designated GAM RNA, to target binding sites on GAM967 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM967 target RNA, herein designated GAM TARGET RNA, into GAM967 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13414] It is appreciated that GAM967 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM967 target genes. The mRNA of each one of this plurality of GAM967 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM967 RNA, herein designated GAM RNA, and which when bound by GAM967 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM967 target proteins.

[13415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM967 gene, herein designated GAM GENE, on one or more GAM967 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13416] It is yet further appreciated that specific functions, and accordingly utilities, of GAM967 correlate with, and may be deduced from, the identity of the target genes which GAM967 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13417] Nucleotide sequences of the GAM967 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM967 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM967 are further described hereinbelow with reference to Table 1.

[13418] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM967 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13419] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 968 (GAM968) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13420] GAM968 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM968 was detected is described hereinabove with reference to Figs. 2-8.

[13421] GAM968 gene, herein designated GAM GENE, and GAM968 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13422] GAM968 gene, herein designated GAM GENE, encodes a GAM968 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM968 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM968 precursor RNA is designated SEQ ID:945, and is provided hereinbelow with reference to the sequence listing part.

[13423] GAM968 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13424] An enzyme complex designated DICER COMPLEX, dices the GAM968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM968 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM968 RNA is designated SEQ ID:3547, and is provided hereinbelow with reference to the sequence listing part.

[13425] GAM968 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM968 target RNA, herein designated GAM TARGET RNA. GAM968 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13426] GAM968 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM968 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM968 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM968 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM968 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13427] The complementary binding of GAM968 RNA, herein designated GAM RNA, to target binding sites on GAM968 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM968 target RNA, herein designated GAM TARGET RNA, into GAM968 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13428] It is appreciated that GAM968 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM968 target genes. The mRNA of each one of this plurality of GAM968 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM968 RNA, herein designated GAM RNA, and which when bound by GAM968 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM968 target proteins.

[13429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM968 gene, herein designated GAM GENE, on one or more

GAM968 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13430] It is yet further appreciated that specific functions, and accordingly utilities, of GAM968 correlate with, and may be deduced from, the identity of the target genes which GAM968 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13431] Nucleotide sequences of the GAM968 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM968 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM968 are further described hereinbelow with reference to Table 1.

[13432] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM968 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13433] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 969 (GAM969) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13434] GAM969 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM969 was detected is described hereinabove with reference to Figs. 2-8.

[13435] GAM969 gene, herein designated GAM GENE, and GAM969 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13436] GAM969 gene, herein designated GAM GENE, encodes a GAM969 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM969 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM969 precursor RNA is designated SEQ ID:946, and is provided hereinbelow with reference to the sequence listing part.

[13437] GAM969 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13438] An enzyme complex designated DICER COMPLEX, dices the GAM969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM969 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM969 RNA is designated SEQ ID:3549, and is provided hereinbelow with reference to the sequence listing part.

[13439] GAM969 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM969 target RNA, herein designated GAM TARGET RNA. GAM969 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13440] GAM969 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM969 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM969 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM969 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM969 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13441] The complementary binding of GAM969 RNA, herein designated GAM RNA, to target binding sites on GAM969 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM969 target RNA, herein designated GAM TARGET RNA, into GAM969 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13442] It is appreciated that GAM969 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM969 target genes. The mRNA of each one of this plurality of GAM969 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM969 RNA, herein designated GAM RNA, and which when bound by GAM969 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM969 target proteins.

[13443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM969 gene, herein designated GAM GENE, on one or more GAM969 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13444] It is yet further appreciated that specific functions, and accordingly utilities, of GAM969 correlate with, and may be deduced from, the identity of the target genes which GAM969 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13445] Nucleotide sequences of the GAM969 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM969 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM969 are further described hereinbelow with reference to Table 1.

[13446] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM969 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13447] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 970 (GAM970) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13448] GAM970 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM970 was detected is described hereinabove with reference to Figs. 2-8.

[13449] GAM970 gene, herein designated GAM GENE, and GAM970 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13450] GAM970 gene, herein designated GAM GENE, encodes a GAM970 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM970 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM970 precursor RNA is designated SEQ ID:947, and is provided hereinbelow with reference to the sequence listing part.

[13451] GAM970 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM970 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13452] An enzyme complex designated DICER COMPLEX, dices the GAM970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM970 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM970 RNA is designated SEQ ID:3548, and is provided hereinbelow with reference to the sequence listing part.

[13453] GAM970 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM970 target RNA, herein designated GAM TARGET RNA. GAM970 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13454] GAM970 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM970

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM970 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM970 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM970 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13455] The complementary binding of GAM970 RNA, herein designated GAM RNA, to target binding sites on GAM970 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM970 target RNA, herein designated GAM TARGET RNA, into GAM970 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13456] It is appreciated that GAM970 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM970 target genes. The mRNA of each one of this plurality of GAM970 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM970 RNA, herein designated GAM RNA, and which when bound by GAM970 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM970 target proteins.

[13457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM970 gene, herein designated GAM GENE, on one or more GAM970 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13458] It is yet further appreciated that specific functions, and accordingly utilities, of GAM970 correlate with, and may be deduced from, the identity of the target genes which GAM970 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13459] Nucleotide sequences of the GAM970 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM970 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM970 are further described hereinbelow with

reference to Table 1.

[13460] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM970 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13461] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 971 (GAM971) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13462] GAM971 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM971 was detected is described hereinabove with reference to Figs. 2-8.

[13463] GAM971 gene, herein designated GAM GENE, and GAM971 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13464] GAM971 gene, herein designated GAM GENE, encodes a GAM971 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM971 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM971 precursor RNA is designated SEQ ID:948, and is provided

hereinbelow with reference to the sequence listing part.

[13465] GAM971 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13466] An enzyme complex designated DICER COMPLEX, dices the GAM971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM971 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM971 RNA is designated SEQ ID:3550, and is provided hereinbelow with reference to the sequence listing part.

[13467] GAM971 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM971 target RNA, herein designated GAM TARGET RNA. GAM971 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[13468] GAM971 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM971 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM971 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM971 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM971 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13469] The complementary binding of GAM971 RNA, herein designated GAM RNA, to target binding sites on GAM971 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM971 target RNA, herein designated GAM TARGET RNA, into GAM971 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13470] It is appreciated that GAM971 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM971 target genes. The mRNA of each one of this plurality of GAM971 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM971 RNA, herein designated GAM RNA, and which when bound by GAM971 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM971 target proteins.

[13471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM971 gene, herein designated GAM GENE, on one or more GAM971 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13472] It is yet further appreciated that specific functions, and accordingly utilities, of GAM971 correlate with, and may be deduced from, the identity of the target genes which GAM971 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13473] Nucleotide sequences of the GAM971 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM971 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM971 are further described hereinbelow with reference to Table 1.

[13474] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM971 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13475] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 972 (GAM972) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13476] GAM972 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM972 was detected is described hereinabove with reference to Figs. 2-8.

[13477] GAM972 gene, herein designated GAM GENE, and GAM972 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13478] GAM972 gene, herein designated GAM GENE, encodes a GAM972 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM972 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM972 precursor RNA is designated SEQ ID:949, and is provided hereinbelow with reference to the sequence listing part.

[13479] GAM972 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13480] An enzyme complex designated DICER COMPLEX, dices the GAM972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM972 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM972 RNA is designated SEQ ID:3551, and is provided hereinbelow with reference to the sequence listing part.

[13481] GAM972 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM972 target RNA, herein designated

GAM TARGET RNA. GAM972 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13482] GAM972 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM972 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM972 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM972 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM972 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13483] The complementary binding of GAM972 RNA, herein designated GAM RNA, to target binding sites on GAM972 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM972 target RNA, herein designated GAM

TARGET RNA, into GAM972 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13484] It is appreciated that GAM972 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM972 target genes. The mRNA of each one of this plurality of GAM972 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM972 RNA, herein designated GAM RNA, and which when bound by GAM972 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM972 target proteins.

[13485] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM972 gene, herein designated GAM GENE, on one or more GAM972 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13486] It is yet further appreciated that specific functions, and accordingly utilities, of GAM972 correlate with, and may be deduced from, the identity of the target

genes which GAM972 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13487] Nucleotide sequences of the GAM972 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM972 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM972 are further described hereinbelow with reference to Table 1.

[13488] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM972 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13489] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 973 (GAM973) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13490] GAM973 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM973 was detected is described hereinabove with reference to Figs. 2-8.

[13491] GAM973 gene, herein designated GAM GENE, and GAM973 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13492] GAM973 gene, herein designated GAM GENE, encodes a GAM973 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM973 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM973 precursor RNA is designated SEQ ID:950, and is provided hereinbelow with reference to the sequence listing part.

[13493] GAM973 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13494] An enzyme complex designated DICER COMPLEX, dices the GAM973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM973 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM973 RNA is designated SEQ ID:3552, and is provided

hereinbelow with reference to the sequence listing part.

[13495] GAM973 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM973 target RNA, herein designated GAM TARGET RNA. GAM973 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13496] GAM973 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM973 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM973 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM973 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM973 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13497] The complementary binding of GAM973 RNA, herein designated GAM RNA, to target binding sites on GAM973 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM973 target RNA, herein designated GAM TARGET RNA, into GAM973 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13498] It is appreciated that GAM973 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM973 target genes. The mRNA of each one of this plurality of GAM973 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM973 RNA, herein designated GAM RNA, and which when bound by GAM973 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM973 target proteins.

[13499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM973 gene, herein designated GAM GENE, on one or more GAM973 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13500] It is yet further appreciated that specific functions, and accordingly utilities, of GAM973 correlate with, and may be deduced from, the identity of the target genes which GAM973 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13501] Nucleotide sequences of the GAM973 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM973 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM973 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM973 are further described hereinbelow with reference to Table 1.

[13502] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM973 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13503] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 974 (GAM974) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13504] GAM974 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM974 was detected is

described hereinabove with reference to Figs. 2-8.

[13505] GAM974 gene, herein designated GAM GENE, and GAM974 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13506] GAM974 gene, herein designated GAM GENE, encodes a GAM974 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM974 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM974 precursor RNA is designated SEQ ID:951, and is provided hereinbelow with reference to the sequence listing part.

[13507] GAM974 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13508] An enzyme complex designated DICER COMPLEX, dices the GAM974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM974 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM974 RNA is designated SEQ ID:3554, and is provided hereinbelow with reference to the sequence listing part.

[13509] GAM974 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM974 target RNA, herein designated GAM TARGET RNA. GAM974 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13510] GAM974 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM974 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM974 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM974 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM974 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13511] The complementary binding of GAM974 RNA, herein designated GAM RNA, to target binding sites on GAM974 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM974 target RNA, herein designated GAM TARGET RNA, into GAM974 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13512] It is appreciated that GAM974 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM974 target genes. The mRNA of each one of this plurality of GAM974 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM974 RNA, herein designated GAM RNA, and which when bound by GAM974 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM974 target proteins.

[13513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM974 gene, herein designated GAM GENE, on one or more GAM974 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13514] It is yet further appreciated that specific functions, and accordingly utilities, of GAM974 correlate with, and may be deduced from, the identity of the target genes which GAM974 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13515] Nucleotide sequences of the GAM974 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM974 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM974 are further described hereinbelow with reference to Table 1.

[13516] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM974 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13517] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 975 (GAM975) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13518] GAM975 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM975 was detected is described hereinabove with reference to Figs. 2-8.

[13519] GAM975 gene, herein designated GAM GENE, and GAM975 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13520] GAM975 gene, herein designated GAM GENE, encodes a GAM975 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM975 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM975 precursor RNA is designated SEQ ID:952, and is provided hereinbelow with reference to the sequence listing part.

[13521] GAM975 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13522] An enzyme complex designated DICER COMPLEX, dices the GAM975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM975 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM975 RNA is designated SEQ ID:3553, and is provided hereinbelow with reference to the sequence listing part.

[13523] GAM975 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM975 target RNA, herein designated GAM TARGET RNA. GAM975 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13524] GAM975 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM975 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM975 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM975 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM975 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13525] The complementary binding of GAM975 RNA, herein designated GAM RNA, to target binding sites on GAM975 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM975 target RNA, herein designated GAM TARGET RNA, into GAM975 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13526] It is appreciated that GAM975 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM975 target genes. The mRNA of each one of this plurality of GAM975 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM975 RNA, herein designated GAM RNA, and which when bound by GAM975 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM975 target proteins.

[13527] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM975 gene, herein designated GAM GENE, on one or more GAM975 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13528] It is yet further appreciated that specific functions, and accordingly utilities, of GAM975 correlate with, and may be deduced from, the identity of the target genes which GAM975 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13529] Nucleotide sequences of the GAM975 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM975 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM975 are further described hereinbelow with reference to Table 1.

[13530] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM975 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13531] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 976 (GAM976) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13532] GAM976 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM976 was detected is described hereinabove with reference to Figs. 2-8.

[13533] GAM976 gene, herein designated GAM GENE, and GAM976 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13534] GAM976 gene, herein designated GAM GENE, encodes a GAM976 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM976 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM976 precursor RNA is designated SEQ ID:953, and is provided hereinbelow with reference to the sequence listing part.

[13535] GAM976 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13536] An enzyme complex designated DICER COMPLEX, dices the GAM976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM976 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM976 RNA is designated SEQ ID:3555, and is provided hereinbelow with reference to the sequence listing part.

[13537] GAM976 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM976 target RNA, herein designated GAM TARGET RNA. GAM976 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13538] GAM976 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM976 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM976 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM976 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM976 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13539] The complementary binding of GAM976 RNA, herein designated GAM RNA, to target binding sites on GAM976 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM976 target RNA, herein designated GAM TARGET RNA, into GAM976 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13540] It is appreciated that GAM976 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM976 target genes. The mRNA of each one of this plurality of GAM976 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM976 RNA, herein designated GAM RNA, and which when bound by GAM976 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM976 target proteins.

[13541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM976 gene, herein designated GAM GENE, on one or more

GAM976 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13542] It is yet further appreciated that specific functions, and accordingly utilities, of GAM976 correlate with, and may be deduced from, the identity of the target genes which GAM976 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13543] Nucleotide sequences of the GAM976 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM976 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM976 are further described hereinbelow with reference to Table 1.

[13544] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM976 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13545] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 977 (GAM977) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13546] GAM977 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM977 was detected is described hereinabove with reference to Figs. 2-8.

[13547] GAM977 gene, herein designated GAM GENE, and GAM977 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13548] GAM977 gene, herein designated GAM GENE, encodes a GAM977 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM977 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM977 precursor RNA is designated SEQ ID:954, and is provided hereinbelow with reference to the sequence listing part.

[13549] GAM977 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM977 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13550] An enzyme complex designated DICER COMPLEX, dices the GAM977 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM977 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM977 RNA is designated SEQ ID:3556, and is provided hereinbelow with reference to the sequence listing part.

[13551] GAM977 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM977 target RNA, herein designated GAM TARGET RNA. GAM977 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13552] GAM977 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM977 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM977 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM977 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM977 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13553] The complementary binding of GAM977 RNA, herein designated GAM RNA, to target binding sites on GAM977 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM977 target RNA, herein designated GAM TARGET RNA, into GAM977 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13554] It is appreciated that GAM977 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM977 target genes. The mRNA of each one of this plurality of GAM977 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM977 RNA, herein designated GAM RNA, and which when bound by GAM977 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM977 target proteins.

[13555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM977 gene, herein designated GAM GENE, on one or more GAM977 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13556] It is yet further appreciated that specific functions, and accordingly utilities, of GAM977 correlate with, and may be deduced from, the identity of the target genes which GAM977 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13557] Nucleotide sequences of the GAM977 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM977 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM977 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM977 are further described hereinbelow with reference to Table 1.

[13558] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM977 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13559] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 978 (GAM978) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13560] GAM978 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM978 was detected is described hereinabove with reference to Figs. 2-8.

[13561] GAM978 gene, herein designated GAM GENE, and GAM978 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13562] GAM978 gene, herein designated GAM GENE, encodes a GAM978 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM978 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM978 precursor RNA is designated SEQ ID:955, and is provided hereinbelow with reference to the sequence listing part.

[13563] GAM978 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM978 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13564] An enzyme complex designated DICER COMPLEX, dices the GAM978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM978 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM978 RNA is designated SEQ ID:3557, and is provided hereinbelow with reference to the sequence listing part.

[13565] GAM978 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM978 target RNA, herein designated GAM TARGET RNA. GAM978 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13566] GAM978 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM978

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM978 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM978 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM978 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13567] The complementary binding of GAM978 RNA, herein designated GAM RNA, to target binding sites on GAM978 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM978 target RNA, herein designated GAM TARGET RNA, into GAM978 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13568] It is appreciated that GAM978 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM978 target genes. The mRNA of each one of this plurality of GAM978 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM978 RNA, herein designated GAM RNA, and which when bound by GAM978 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM978 target proteins.

[13569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM978 gene, herein designated GAM GENE, on one or more GAM978 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13570] It is yet further appreciated that specific functions, and accordingly utilities, of GAM978 correlate with, and may be deduced from, the identity of the target genes which GAM978 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13571] Nucleotide sequences of the GAM978 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM978 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM978 are further described hereinbelow with

reference to Table 1.

[13572] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM978 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13573] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 979 (GAM979) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13574] GAM979 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM979 was detected is described hereinabove with reference to Figs. 2-8.

[13575] GAM979 gene, herein designated GAM GENE, and GAM979 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13576] GAM979 gene, herein designated GAM GENE, encodes a GAM979 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM979 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM979 precursor RNA is designated SEQ ID:956, and is provided

hereinbelow with reference to the sequence listing part.

[13577] GAM979 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13578] An enzyme complex designated DICER COMPLEX, dices the GAM979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM979 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM979 RNA is designated SEQ ID:3558, and is provided hereinbelow with reference to the sequence listing part.

[13579] GAM979 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM979 target RNA, herein designated GAM TARGET RNA. GAM979 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[13580] GAM979 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM979 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM979 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM979 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM979 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13581] The complementary binding of GAM979 RNA, herein designated GAM RNA, to target binding sites on GAM979 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM979 target RNA, herein designated GAM TARGET RNA, into GAM979 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13582] It is appreciated that GAM979 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM979 target genes. The mRNA of each one of this plurality of GAM979 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM979 RNA, herein designated GAM RNA, and which when bound by GAM979 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM979 target proteins.

[13583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM979 gene, herein designated GAM GENE, on one or more GAM979 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13584] It is yet further appreciated that specific functions, and accordingly utilities, of GAM979 correlate with, and may be deduced from, the identity of the target genes which GAM979 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13585] Nucleotide sequences of the GAM979 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM979 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM979 are further described hereinbelow with reference to Table 1.

[13586] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM979 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13587] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 980 (GAM980) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13588] GAM980 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM980 was detected is described hereinabove with reference to Figs. 2-8.

[13589] GAM980 gene, herein designated GAM GENE, and GAM980 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13590] GAM980 gene, herein designated GAM GENE, encodes a GAM980 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM980 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM980 precursor RNA is designated SEQ ID:957, and is provided hereinbelow with reference to the sequence listing part.

[13591] GAM980 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13592] An enzyme complex designated DICER COMPLEX, dices the GAM980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM980 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM980 RNA is designated SEQ ID:3559, and is provided hereinbelow with reference to the sequence listing part.

[13593] GAM980 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM980 target RNA, herein designated

GAM TARGET RNA. GAM980 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13594] GAM980 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM980 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM980 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM980 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM980 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13595] The complementary binding of GAM980 RNA, herein designated GAM RNA, to target binding sites on GAM980 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM980 target RNA, herein designated GAM

TARGET RNA, into GAM980 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13596] It is appreciated that GAM980 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM980 target genes. The mRNA of each one of this plurality of GAM980 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM980 RNA, herein designated GAM RNA, and which when bound by GAM980 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM980 target proteins.

[13597] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM980 gene, herein designated GAM GENE, on one or more GAM980 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13598] It is yet further appreciated that specific functions, and accordingly utilities, of GAM980 correlate with, and may be deduced from, the identity of the target

genes which GAM980 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13599] Nucleotide sequences of the GAM980 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM980 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM980 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM980 are further described hereinbelow with reference to Table 1.

[13600] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM980 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13601] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 981 (GAM981) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13602] GAM981 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM981 was detected is described hereinabove with reference to Figs. 2-8.

[13603] GAM981 gene, herein designated GAM GENE, and GAM981 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13604] GAM981 gene, herein designated GAM GENE, encodes a GAM981 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM981 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM981 precursor RNA is designated SEQ ID:958, and is provided hereinbelow with reference to the sequence listing part.

[13605] GAM981 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13606] An enzyme complex designated DICER COMPLEX, dices the GAM981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM981 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM981 RNA is designated SEQ ID:3560, and is provided

hereinbelow with reference to the sequence listing part.

[13607] GAM981 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM981 target RNA, herein designated GAM TARGET RNA. GAM981 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13608] GAM981 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM981 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM981 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM981 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM981 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13609] The complementary binding of GAM981 RNA, herein designated GAM RNA, to target binding sites on GAM981 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM981 target RNA, herein designated GAM TARGET RNA, into GAM981 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13610] It is appreciated that GAM981 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM981 target genes. The mRNA of each one of this plurality of GAM981 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM981 RNA, herein designated GAM RNA, and which when bound by GAM981 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM981 target proteins.

[13611] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM981 gene, herein designated GAM GENE, on one or more GAM981 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13612] It is yet further appreciated that specific functions, and accordingly utilities, of GAM981 correlate with, and may be deduced from, the identity of the target genes which GAM981 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13613] Nucleotide sequences of the GAM981 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM981 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM981 are further described hereinbelow with reference to Table 1.

[13614] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM981 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13615] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 982 (GAM982) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13616] GAM982 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM982 was detected is

described hereinabove with reference to Figs. 2-8.

[13617] GAM982 gene, herein designated GAM GENE, and GAM982 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13618] GAM982 gene, herein designated GAM GENE, encodes a GAM982 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM982 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM982 precursor RNA is designated SEQ ID:959, and is provided hereinbelow with reference to the sequence listing part.

[13619] GAM982 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13620] An enzyme complex designated DICER COMPLEX, dices the GAM982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM982 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM982 RNA is designated SEQ ID:3561, and is provided hereinbelow with reference to the sequence listing part.

[13621] GAM982 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM982 target RNA, herein designated GAM TARGET RNA. GAM982 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13622] GAM982 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM982 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM982 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM982 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM982 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13623] The complementary binding of GAM982 RNA, herein designated GAM RNA, to target binding sites on GAM982 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM982 target RNA, herein designated GAM TARGET RNA, into GAM982 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13624] It is appreciated that GAM982 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM982 target genes. The mRNA of each one of this plurality of GAM982 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM982 RNA, herein designated GAM RNA, and which when bound by GAM982 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM982 target proteins.

[13625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM982 gene, herein designated GAM GENE, on one or more GAM982 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13626] It is yet further appreciated that specific functions, and accordingly utilities, of GAM982 correlate with, and may be deduced from, the identity of the target genes which GAM982 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13627] Nucleotide sequences of the GAM982 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM982 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM982 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM982 are further described hereinbelow with reference to Table 1.

[13628] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM982 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13629] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 983 (GAM983) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13630] GAM983 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM983 was detected is described hereinabove with reference to Figs. 2-8.

[13631] GAM983 gene, herein designated GAM GENE, and GAM983 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13632] GAM983 gene, herein designated GAM GENE, encodes a GAM983 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM983 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM983 precursor RNA is designated SEQ ID:960, and is provided hereinbelow with reference to the sequence listing part.

[13633] GAM983 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13634] An enzyme complex designated DICER COMPLEX, dices the GAM983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM983 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM983 RNA is designated SEQ ID:3562, and is provided hereinbelow with reference to the sequence listing part.

[13635] GAM983 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM983 target RNA, herein designated GAM TARGET RNA. GAM983 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13636] GAM983 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM983 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM983 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM983 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM983 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13637] The complementary binding of GAM983 RNA, herein designated GAM RNA, to target binding sites on GAM983 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM983 target RNA, herein designated GAM TARGET RNA, into GAM983 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13638] It is appreciated that GAM983 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM983 target genes. The mRNA of each one of this plurality of GAM983 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM983 RNA, herein designated GAM RNA, and which when bound by GAM983 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM983 target proteins.

[13639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM983 gene, herein designated GAM GENE, on one or more GAM983 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13640] It is yet further appreciated that specific functions, and accordingly utilities, of GAM983 correlate with, and may be deduced from, the identity of the target genes which GAM983 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13641] Nucleotide sequences of the GAM983 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM983 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM983 are further described hereinbelow with reference to Table 1.

[13642] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM983 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13643] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 984 (GAM984) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13644] GAM984 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM984 was detected is described hereinabove with reference to Figs. 2-8.

[13645] GAM984 gene, herein designated GAM GENE, and GAM984 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13646] GAM984 gene, herein designated GAM GENE, encodes a GAM984 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM984 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM984 precursor RNA is designated SEQ ID:961, and is provided hereinbelow with reference to the sequence listing part.

[13647] GAM984 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13648] An enzyme complex designated DICER COMPLEX, dices the GAM984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM984 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM984 RNA is designated SEQ ID:3563, and is provided hereinbelow with reference to the sequence listing part.

[13649] GAM984 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM984 target RNA, herein designated GAM TARGET RNA. GAM984 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13650] GAM984 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM984 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM984 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM984 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM984 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13651] The complementary binding of GAM984 RNA, herein designated GAM RNA, to target binding sites on GAM984 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM984 target RNA, herein designated GAM TARGET RNA, into GAM984 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13652] It is appreciated that GAM984 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM984 target genes. The mRNA of each one of this plurality of GAM984 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM984 RNA, herein designated GAM RNA, and which when bound by GAM984 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM984 target proteins.

[13653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM984 gene, herein designated GAM GENE, on one or more

GAM984 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13654] It is yet further appreciated that specific functions, and accordingly utilities, of GAM984 correlate with, and may be deduced from, the identity of the target genes which GAM984 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13655] Nucleotide sequences of the GAM984 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM984 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM984 are further described hereinbelow with reference to Table 1.

[13656] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM984 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13657] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 985 (GAM985) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13658] GAM985 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM985 was detected is described hereinabove with reference to Figs. 2-8.

[13659] GAM985 gene, herein designated GAM GENE, and GAM985 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13660] GAM985 gene, herein designated GAM GENE, encodes a GAM985 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM985 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM985 precursor RNA is designated SEQ ID:962, and is provided hereinbelow with reference to the sequence listing part.

[13661] GAM985 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM985 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13662] An enzyme complex designated DICER COMPLEX, dices the GAM985 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM985 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM985 RNA is designated SEQ ID:3564, and is provided hereinbelow with reference to the sequence listing part.

[13663] GAM985 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM985 target RNA, herein designated GAM TARGET RNA. GAM985 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13664] GAM985 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM985 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM985 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM985 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM985 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13665] The complementary binding of GAM985 RNA, herein designated GAM RNA, to target binding sites on GAM985 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM985 target RNA, herein designated GAM TARGET RNA, into GAM985 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13666] It is appreciated that GAM985 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM985 target genes. The mRNA of each one of this plurality of GAM985 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM985 RNA, herein designated GAM RNA, and which when bound by GAM985 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM985 target proteins.

[13667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM985 gene, herein designated GAM GENE, on one or more GAM985 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13668] It is yet further appreciated that specific functions, and accordingly utilities, of GAM985 correlate with, and may be deduced from, the identity of the target genes which GAM985 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13669] Nucleotide sequences of the GAM985 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM985 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM985 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM985 are further described hereinbelow with reference to Table 1.

[13670] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM985 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13671] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 986 (GAM986) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13672] GAM986 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM986 was detected is described hereinabove with reference to Figs. 2-8.

[13673] GAM986 gene, herein designated GAM GENE, and GAM986 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13674] GAM986 gene, herein designated GAM GENE, encodes a GAM986 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM986 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM986 precursor RNA is designated SEQ ID:963, and is provided hereinbelow with reference to the sequence listing part.

[13675] GAM986 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM986 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13676] An enzyme complex designated DICER COMPLEX, dices the GAM986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM986 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM986 RNA is designated SEQ ID:3565, and is provided hereinbelow with reference to the sequence listing part.

[13677] GAM986 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM986 target RNA, herein designated GAM TARGET RNA. GAM986 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13678] GAM986 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM986

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM986 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM986 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM986 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13679] The complementary binding of GAM986 RNA, herein designated GAM RNA, to target binding sites on GAM986 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM986 target RNA, herein designated GAM TARGET RNA, into GAM986 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13680] It is appreciated that GAM986 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM986 target genes. The mRNA of each one of this plurality of GAM986 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM986 RNA, herein designated GAM RNA, and which when bound by GAM986 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM986 target proteins.

[13681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM986 gene, herein designated GAM GENE, on one or more GAM986 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13682] It is yet further appreciated that specific functions, and accordingly utilities, of GAM986 correlate with, and may be deduced from, the identity of the target genes which GAM986 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13683] Nucleotide sequences of the GAM986 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM986 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM986 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM986 are further described hereinbelow with

reference to Table 1.

[13684] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM986 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13685] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 987 (GAM987) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13686] GAM987 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM987 was detected is described hereinabove with reference to Figs. 2-8.

[13687] GAM987 gene, herein designated GAM GENE, and GAM987 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13688] GAM987 gene, herein designated GAM GENE, encodes a GAM987 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM987 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM987 precursor RNA is designated SEQ ID:964, and is provided

hereinbelow with reference to the sequence listing part.

[13689] GAM987 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM987 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13690] An enzyme complex designated DICER COMPLEX, dices the GAM987 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM987 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM987 RNA is designated SEQ ID:3566, and is provided hereinbelow with reference to the sequence listing part.

[13691] GAM987 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM987 target RNA, herein designated GAM TARGET RNA. GAM987 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[13692] GAM987 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM987 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM987 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM987 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM987 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13693] The complementary binding of GAM987 RNA, herein designated GAM RNA, to target binding sites on GAM987 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM987 target RNA, herein designated GAM TARGET RNA, into GAM987 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13694] It is appreciated that GAM987 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM987 target genes. The mRNA of each one of this plurality of GAM987 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM987 RNA, herein designated GAM RNA, and which when bound by GAM987 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM987 target proteins.

[13695] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM987 gene, herein designated GAM GENE, on one or more GAM987 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13696] It is yet further appreciated that specific functions, and accordingly utilities, of GAM987 correlate with, and may be deduced from, the identity of the target genes which GAM987 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13697] Nucleotide sequences of the GAM987 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM987 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM987 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM987 are further described hereinbelow with reference to Table 1.

[13698] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM987 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13699] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 988 (GAM988) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13700] GAM988 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM988 was detected is described hereinabove with reference to Figs. 2-8.

[13701] GAM988 gene, herein designated GAM GENE, and GAM988 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13702] GAM988 gene, herein designated GAM GENE, encodes a GAM988 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM988 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM988 precursor RNA is designated SEQ ID:965, and is provided hereinbelow with reference to the sequence listing part.

[13703] GAM988 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM988 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13704] An enzyme complex designated DICER COMPLEX, dices the GAM988 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM988 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM988 RNA is designated SEQ ID:3567, and is provided hereinbelow with reference to the sequence listing part.

[13705] GAM988 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM988 target RNA, herein designated

GAM TARGET RNA. GAM988 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13706] GAM988 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM988 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM988 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM988 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM988 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13707] The complementary binding of GAM988 RNA, herein designated GAM RNA, to target binding sites on GAM988 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM988 target RNA, herein designated GAM

TARGET RNA, into GAM988 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13708] It is appreciated that GAM988 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM988 target genes. The mRNA of each one of this plurality of GAM988 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM988 RNA, herein designated GAM RNA, and which when bound by GAM988 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM988 target proteins.

[13709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM988 gene, herein designated GAM GENE, on one or more GAM988 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13710] It is yet further appreciated that specific functions, and accordingly utilities, of GAM988 correlate with, and may be deduced from, the identity of the target

genes which GAM988 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13711] Nucleotide sequences of the GAM988 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM988 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM988 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM988 are further described hereinbelow with reference to Table 1.

[13712] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM988 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13713] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 989 (GAM989) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13714] GAM989 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM989 was detected is described hereinabove with reference to Figs. 2-8.

[13715] GAM989 gene, herein designated GAM GENE, and GAM989 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13716] GAM989 gene, herein designated GAM GENE, encodes a GAM989 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM989 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM989 precursor RNA is designated SEQ ID:966, and is provided hereinbelow with reference to the sequence listing part.

[13717] GAM989 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13718] An enzyme complex designated DICER COMPLEX, dices the GAM989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM989 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM989 RNA is designated SEQ ID:3569, and is provided

hereinbelow with reference to the sequence listing part.

[13719] GAM989 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM989 target RNA, herein designated GAM TARGET RNA. GAM989 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13720] GAM989 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM989 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM989 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM989 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM989 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13721] The complementary binding of GAM989 RNA, herein designated GAM RNA, to target binding sites on GAM989 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM989 target RNA, herein designated GAM TARGET RNA, into GAM989 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13722] It is appreciated that GAM989 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM989 target genes. The mRNA of each one of this plurality of GAM989 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM989 RNA, herein designated GAM RNA, and which when bound by GAM989 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM989 target proteins.

[13723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM989 gene, herein designated GAM GENE, on one or more GAM989 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13724] It is yet further appreciated that specific functions, and accordingly utilities, of GAM989 correlate with, and may be deduced from, the identity of the target genes which GAM989 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13725] Nucleotide sequences of the GAM989 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM989 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM989 are further described hereinbelow with reference to Table 1.

[13726] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM989 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13727] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 990 (GAM990) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13728] GAM990 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM990 was detected is

described hereinabove with reference to Figs. 2-8.

[13729] GAM990 gene, herein designated GAM GENE, and GAM990 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13730] GAM990 gene, herein designated GAM GENE, encodes a GAM990 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM990 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM990 precursor RNA is designated SEQ ID:967, and is provided hereinbelow with reference to the sequence listing part.

[13731] GAM990 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13732] An enzyme complex designated DICER COMPLEX, dices the GAM990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM990 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM990 RNA is designated SEQ ID:3570, and is provided hereinbelow with reference to the sequence listing part.

[13733] GAM990 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM990 target RNA, herein designated GAM TARGET RNA. GAM990 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13734] GAM990 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM990 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM990 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM990 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM990 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13735] The complementary binding of GAM990 RNA, herein designated GAM RNA, to target binding sites on GAM990 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM990 target RNA, herein designated GAM TARGET RNA, into GAM990 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13736] It is appreciated that GAM990 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM990 target genes. The mRNA of each one of this plurality of GAM990 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM990 RNA, herein designated GAM RNA, and which when bound by GAM990 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM990 target proteins.

[13737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM990 gene, herein designated GAM GENE, on one or more GAM990 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13738] It is yet further appreciated that specific functions, and accordingly utilities, of GAM990 correlate with, and may be deduced from, the identity of the target genes which GAM990 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13739] Nucleotide sequences of the GAM990 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM990 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM990 are further described hereinbelow with reference to Table 1.

[13740] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM990 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13741] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 991 (GAM991) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13742] GAM991 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM991 was detected is described hereinabove with reference to Figs. 2-8.

[13743] GAM991 gene, herein designated GAM GENE, and GAM991 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13744] GAM991 gene, herein designated GAM GENE, encodes a GAM991 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM991 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM991 precursor RNA is designated SEQ ID:968, and is provided hereinbelow with reference to the sequence listing part.

[13745] GAM991 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13746] An enzyme complex designated DICER COMPLEX, dices the GAM991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM991 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM991 RNA is designated SEQ ID:3568, and is provided hereinbelow with reference to the sequence listing part.

[13747] GAM991 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM991 target RNA, herein designated GAM TARGET RNA. GAM991 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13748] GAM991 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM991 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM991 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM991 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM991 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13749] The complementary binding of GAM991 RNA, herein designated GAM RNA, to target binding sites on GAM991 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM991 target RNA, herein designated GAM TARGET RNA, into GAM991 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13750] It is appreciated that GAM991 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM991 target genes. The mRNA of each one of this plurality of GAM991 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM991 RNA, herein designated GAM RNA, and which when bound by GAM991 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM991 target proteins.

[13751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM991 gene, herein designated GAM GENE, on one or more GAM991 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13752] It is yet further appreciated that specific functions, and accordingly utilities, of GAM991 correlate with, and may be deduced from, the identity of the target genes which GAM991 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13753] Nucleotide sequences of the GAM991 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM991 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM991 are further described hereinbelow with reference to Table 1.

[13754] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM991 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13755] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 992 (GAM992) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13756] GAM992 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM992 was detected is described hereinabove with reference to Figs. 2-8.

[13757] GAM992 gene, herein designated GAM GENE, and GAM992 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13758] GAM992 gene, herein designated GAM GENE, encodes a GAM992 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM992 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM992 precursor RNA is designated SEQ ID:969, and is provided hereinbelow with reference to the sequence listing part.

[13759] GAM992 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13760] An enzyme complex designated DICER COMPLEX, dices the GAM992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM992 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM992 RNA is designated SEQ ID:3571, and is provided hereinbelow with reference to the sequence listing part.

[13761] GAM992 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM992 target RNA, herein designated GAM TARGET RNA. GAM992 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13762] GAM992 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM992 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM992 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM992 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM992 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13763] The complementary binding of GAM992 RNA, herein designated GAM RNA, to target binding sites on GAM992 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM992 target RNA, herein designated GAM TARGET RNA, into GAM992 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13764] It is appreciated that GAM992 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM992 target genes. The mRNA of each one of this plurality of GAM992 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM992 RNA, herein designated GAM RNA, and which when bound by GAM992 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM992 target proteins.

[13765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM992 gene, herein designated GAM GENE, on one or more

GAM992 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13766] It is yet further appreciated that specific functions, and accordingly utilities, of GAM992 correlate with, and may be deduced from, the identity of the target genes which GAM992 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13767] Nucleotide sequences of the GAM992 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM992 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM992 are further described hereinbelow with reference to Table 1.

[13768] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM992 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13769] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 993 (GAM993) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13770] GAM993 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM993 was detected is described hereinabove with reference to Figs. 2-8.

[13771] GAM993 gene, herein designated GAM GENE, and GAM993 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13772] GAM993 gene, herein designated GAM GENE, encodes a GAM993 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM993 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM993 precursor RNA is designated SEQ ID:970, and is provided hereinbelow with reference to the sequence listing part.

[13773] GAM993 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM993 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13774] An enzyme complex designated DICER COMPLEX, dices the GAM993 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM993 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM993 RNA is designated SEQ ID:3573, and is provided hereinbelow with reference to the sequence listing part.

[13775] GAM993 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM993 target RNA, herein designated GAM TARGET RNA. GAM993 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13776] GAM993 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM993 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM993 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM993 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM993 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13777] The complementary binding of GAM993 RNA, herein designated GAM RNA, to target binding sites on GAM993 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM993 target RNA, herein designated GAM TARGET RNA, into GAM993 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13778] It is appreciated that GAM993 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM993 target genes. The mRNA of each one of this plurality of GAM993 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM993 RNA, herein designated GAM RNA, and which when bound by GAM993 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM993 target proteins.

[13779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM993 gene, herein designated GAM GENE, on one or more GAM993 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13780] It is yet further appreciated that specific functions, and accordingly utilities, of GAM993 correlate with, and may be deduced from, the identity of the target genes which GAM993 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13781] Nucleotide sequences of the GAM993 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM993 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM993 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM993 are further described hereinbelow with reference to Table 1.

[13782] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM993 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13783] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 994 (GAM994) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13784] GAM994 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM994 was detected is described hereinabove with reference to Figs. 2-8.

[13785] GAM994 gene, herein designated GAM GENE, and GAM994 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13786] GAM994 gene, herein designated GAM GENE, encodes a GAM994 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM994 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM994 precursor RNA is designated SEQ ID:971, and is provided hereinbelow with reference to the sequence listing part.

[13787] GAM994 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM994 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13788] An enzyme complex designated DICER COMPLEX, dices the GAM994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM994 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM994 RNA is designated SEQ ID:3572, and is provided hereinbelow with reference to the sequence listing part.

[13789] GAM994 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM994 target RNA, herein designated GAM TARGET RNA. GAM994 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13790] GAM994 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM994

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM994 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM994 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM994 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13791] The complementary binding of GAM994 RNA, herein designated GAM RNA, to target binding sites on GAM994 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM994 target RNA, herein designated GAM TARGET RNA, into GAM994 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13792] It is appreciated that GAM994 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM994 target genes. The mRNA of each one of this plurality of GAM994 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM994 RNA, herein designated GAM RNA, and which when bound by GAM994 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM994 target proteins.

[13793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM994 gene, herein designated GAM GENE, on one or more GAM994 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13794] It is yet further appreciated that specific functions, and accordingly utilities, of GAM994 correlate with, and may be deduced from, the identity of the target genes which GAM994 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13795] Nucleotide sequences of the GAM994 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM994 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM994 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM994 are further described hereinbelow with

reference to Table 1.

[13796] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM994 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13797] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 995 (GAM995) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13798] GAM995 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM995 was detected is described hereinabove with reference to Figs. 2-8.

[13799] GAM995 gene, herein designated GAM GENE, and GAM995 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13800] GAM995 gene, herein designated GAM GENE, encodes a GAM995 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM995 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM995 precursor RNA is designated SEQ ID:972, and is provided

hereinbelow with reference to the sequence listing part.

[13801] GAM995 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13802] An enzyme complex designated DICER COMPLEX, dices the GAM995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM995 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM995 RNA is designated SEQ ID:3574, and is provided hereinbelow with reference to the sequence listing part.

[13803] GAM995 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM995 target RNA, herein designated GAM TARGET RNA. GAM995 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[13804] GAM995 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM995 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM995 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM995 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM995 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13805] The complementary binding of GAM995 RNA, herein designated GAM RNA, to target binding sites on GAM995 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM995 target RNA, herein designated GAM TARGET RNA, into GAM995 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13806] It is appreciated that GAM995 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM995 target genes. The mRNA of each one of this plurality of GAM995 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM995 RNA, herein designated GAM RNA, and which when bound by GAM995 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM995 target proteins.

[13807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM995 gene, herein designated GAM GENE, on one or more GAM995 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13808] It is yet further appreciated that specific functions, and accordingly utilities, of GAM995 correlate with, and may be deduced from, the identity of the target genes which GAM995 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13809] Nucleotide sequences of the GAM995 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM995 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM995 are further described hereinbelow with reference to Table 1.

[13810] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM995 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13811] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 996 (GAM996) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13812] GAM996 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM996 was detected is described hereinabove with reference to Figs. 2-8.

[13813] GAM996 gene, herein designated GAM GENE, and GAM996 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13814] GAM996 gene, herein designated GAM GENE, encodes a GAM996 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM996 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM996 precursor RNA is designated SEQ ID:973, and is provided hereinbelow with reference to the sequence listing part.

[13815] GAM996 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13816] An enzyme complex designated DICER COMPLEX, dices the GAM996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM996 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM996 RNA is designated SEQ ID:3575, and is provided hereinbelow with reference to the sequence listing part.

[13817] GAM996 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM996 target RNA, herein designated

GAM TARGET RNA. GAM996 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13818] GAM996 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM996 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM996 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM996 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM996 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13819] The complementary binding of GAM996 RNA, herein designated GAM RNA, to target binding sites on GAM996 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM996 target RNA, herein designated GAM

TARGET RNA, into GAM996 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13820] It is appreciated that GAM996 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM996 target genes. The mRNA of each one of this plurality of GAM996 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM996 RNA, herein designated GAM RNA, and which when bound by GAM996 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM996 target proteins.

[13821] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM996 gene, herein designated GAM GENE, on one or more GAM996 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13822] It is yet further appreciated that specific functions, and accordingly utilities, of GAM996 correlate with, and may be deduced from, the identity of the target

genes which GAM996 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13823] Nucleotide sequences of the GAM996 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM996 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM996 are further described hereinbelow with reference to Table 1.

[13824] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM996 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13825] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 997 (GAM997) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13826] GAM997 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM997 was detected is described hereinabove with reference to Figs. 2-8.

[13827] GAM997 gene, herein designated GAM GENE, and GAM997 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13828] GAM997 gene, herein designated GAM GENE, encodes a GAM997 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM997 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM997 precursor RNA is designated SEQ ID:974, and is provided hereinbelow with reference to the sequence listing part.

[13829] GAM997 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13830] An enzyme complex designated DICER COMPLEX, dices the GAM997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM997 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM997 RNA is designated SEQ ID:3576, and is provided

hereinbelow with reference to the sequence listing part.

[13831] GAM997 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM997 target RNA, herein designated GAM TARGET RNA. GAM997 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13832] GAM997 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM997 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM997 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM997 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM997 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13833] The complementary binding of GAM997 RNA, herein designated GAM RNA, to target binding sites on GAM997 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM997 target RNA, herein designated GAM TARGET RNA, into GAM997 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13834] It is appreciated that GAM997 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM997 target genes. The mRNA of each one of this plurality of GAM997 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM997 RNA, herein designated GAM RNA, and which when bound by GAM997 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM997 target proteins.

[13835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM997 gene, herein designated GAM GENE, on one or more GAM997 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13836] It is yet further appreciated that specific functions, and accordingly utilities, of GAM997 correlate with, and may be deduced from, the identity of the target genes which GAM997 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13837] Nucleotide sequences of the GAM997 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM997 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM997 are further described hereinbelow with reference to Table 1.

[13838] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM997 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13839] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 998 (GAM998) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13840] GAM998 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM998 was detected is

described hereinabove with reference to Figs. 2-8.

[13841] GAM998 gene, herein designated GAM GENE, and GAM998 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13842] GAM998 gene, herein designated GAM GENE, encodes a GAM998 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM998 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM998 precursor RNA is designated SEQ ID:975, and is provided hereinbelow with reference to the sequence listing part.

[13843] GAM998 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13844] An enzyme complex designated DICER COMPLEX, dices the GAM998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM998 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM998 RNA is designated SEQ ID:3577, and is provided hereinbelow with reference to the sequence listing part.

[13845] GAM998 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM998 target RNA, herein designated GAM TARGET RNA. GAM998 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13846] GAM998 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM998 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM998 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM998 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM998 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13847] The complementary binding of GAM998 RNA, herein designated GAM RNA, to target binding sites on GAM998 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM998 target RNA, herein designated GAM TARGET RNA, into GAM998 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13848] It is appreciated that GAM998 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM998 target genes. The mRNA of each one of this plurality of GAM998 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM998 RNA, herein designated GAM RNA, and which when bound by GAM998 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM998 target proteins.

[13849] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM998 gene, herein designated GAM GENE, on one or more GAM998 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13850] It is yet further appreciated that specific functions, and accordingly utilities, of GAM998 correlate with, and may be deduced from, the identity of the target genes which GAM998 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13851] Nucleotide sequences of the GAM998 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM998 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM998 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM998 are further described hereinbelow with reference to Table 1.

[13852] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM998 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13853] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 999 (GAM999) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13854] GAM999 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM999 was detected is described hereinabove with reference to Figs. 2-8.

[13855] GAM999 gene, herein designated GAM GENE, and GAM999 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13856] GAM999 gene, herein designated GAM GENE, encodes a GAM999 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM999 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM999 precursor RNA is designated SEQ ID:976, and is provided hereinbelow with reference to the sequence listing part.

[13857] GAM999 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13858] An enzyme complex designated DICER COMPLEX, dices the GAM999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM999 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM999 RNA is designated SEQ ID:3578, and is provided hereinbelow with reference to the sequence listing part.

[13859] GAM999 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM999 target RNA, herein designated GAM TARGET RNA. GAM999 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13860] GAM999 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM999 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM999 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM999 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM999 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13861] The complementary binding of GAM999 RNA, herein designated GAM RNA, to target binding sites on GAM999 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM999 target RNA, herein designated GAM TARGET RNA, into GAM999 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13862] It is appreciated that GAM999 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM999 target genes. The mRNA of each one of this plurality of GAM999 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM999 RNA, herein designated GAM RNA, and which when bound by GAM999 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM999 target proteins.

[13863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM999 gene, herein designated GAM GENE, on one or more GAM999 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13864] It is yet further appreciated that specific functions, and accordingly utilities, of GAM999 correlate with, and may be deduced from, the identity of the target genes which GAM999 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13865] Nucleotide sequences of the GAM999 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM999 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM999 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM999 are further described hereinbelow with reference to Table 1.

[13866] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM999 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13867] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1000 (GAM1000) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13868] GAM1000 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1000 was detected is described hereinabove with reference to Figs. 2-8.

[13869] GAM1000 gene, herein designated GAM GENE, and GAM1000 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13870] GAM1000 gene, herein designated GAM GENE, encodes a GAM1000 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1000 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1000 precursor RNA is designated SEQ ID:977, and is provided hereinbelow with reference to the sequence listing part.

[13871] GAM1000 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13872] An enzyme complex designated DICER COMPLEX, dices the GAM1000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1000 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1000 RNA is designated SEQ ID:3579, and is provided hereinbelow with reference to the sequence listing part.

[13873] GAM1000 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1000 target RNA, herein designated GAM TARGET RNA. GAM1000 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13874] GAM1000 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1000 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1000 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1000 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1000 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13875] The complementary binding of GAM1000 RNA, herein designated GAM RNA, to target binding sites on GAM1000 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1000 target RNA, herein designated GAM TARGET RNA, into GAM1000 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13876] It is appreciated that GAM1000 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1000 target genes. The mRNA of each one of this plurality of GAM1000 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1000 RNA, herein designated GAM RNA, and which when bound by GAM1000 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1000 target proteins.

[13877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1000 gene, herein designated GAM GENE, on one or more GAM1000 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13878] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1000 correlate with, and may be deduced from, the identity of the target genes which GAM1000 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13879] Nucleotide sequences of the GAM1000 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1000 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1000 are further described hereinbelow with reference to Table 1.

[13880] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1000 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[13881] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1001 (GAM1001) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13882] GAM1001 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1001 was detected is described hereinabove with reference to Figs. 2-8.

[13883] GAM1001 gene, herein designated GAM GENE, and GAM1001 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13884] GAM1001 gene, herein designated GAM GENE, encodes a GAM1001 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1001 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1001 precursor RNA is designated SEQ ID:978, and is provided hereinbelow with reference to the sequence listing part.

[13885] GAM1001 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13886] An enzyme complex designated DICER COMPLEX, dices the GAM1001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1001 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1001 RNA is designated SEQ ID:3580, and is provided hereinbelow with reference to the sequence listing part.

[13887] GAM1001 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1001 target RNA, herein designated GAM TARGET RNA. GAM1001 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13888] GAM1001 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1001 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1001 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1001 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1001 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13889] The complementary binding of GAM1001 RNA, herein designated GAM RNA, to target binding sites on GAM1001 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1001 target RNA, herein designated GAM TARGET RNA, into GAM1001 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13890] It is appreciated that GAM1001 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1001 target genes. The mRNA of each one of this plurality of GAM1001 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1001 RNA, herein designated GAM RNA, and which when bound by GAM1001 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1001 target proteins.

[13891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1001 gene, herein designated GAM GENE, on one or more GAM1001 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13892] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1001 correlate with, and may be deduced from, the identity of the target genes which GAM1001 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13893] Nucleotide sequences of the GAM1001 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1001 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1001 are further described hereinbelow with reference to Table 1.

[13894] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1001 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13895] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1002 (GAM1002) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13896] GAM1002 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1002 was detected is described hereinabove with reference to Figs. 2-8.

[13897] GAM1002 gene, herein designated GAM GENE, and GAM1002 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13898] GAM1002 gene, herein designated GAM GENE, encodes a GAM1002 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1002 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1002 precursor RNA is designated SEQ ID:979, and is provided hereinbelow with reference to the sequence listing part.

[13899] GAM1002 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1002 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13900] An enzyme complex designated DICER COMPLEX, dices the GAM1002 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1002 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1002 RNA is designated SEQ ID:3582, and is provided hereinbelow with reference to the sequence listing part.

[13901] GAM1002 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1002 target RNA, herein designated GAM TARGET RNA. GAM1002 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13902] GAM1002 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1002 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1002 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1002 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1002 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13903] The complementary binding of GAM1002 RNA, herein designated GAM RNA, to target binding sites on GAM1002 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1002 target RNA, herein designated GAM TARGET RNA, into GAM1002 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13904] It is appreciated that GAM1002 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1002 target genes. The

mRNA of each one of this plurality of GAM1002 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1002 RNA, herein designated GAM RNA, and which when bound by GAM1002 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1002 target proteins.

[13905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1002 gene, herein designated GAM GENE, on one or more GAM1002 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13906] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1002 correlate with, and may be deduced from, the identity of the target genes which GAM1002 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13907] Nucleotide sequences of the GAM1002 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1002 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1002 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1002 are further described hereinbelow with reference to Table 1.

[13908] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1002 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13909] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1003 (GAM1003) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13910] GAM1003 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1003 was detected is described hereinabove with reference to Figs. 2-8.

[13911] GAM1003 gene, herein designated GAM GENE, and GAM1003 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13912] GAM1003 gene, herein designated GAM GENE, encodes a GAM1003 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1003 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1003 precursor RNA is designated SEQ ID:980, and is provided hereinbelow with reference to the sequence listing part.

[13913] GAM1003 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13914] An enzyme complex designated DICER COMPLEX, dices the GAM1003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1003 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1003 RNA is designated SEQ ID:3581, and is provided hereinbelow with reference to the sequence listing part.

[13915] GAM1003 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1003 target RNA, herein designated GAM TARGET RNA. GAM1003 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13916] GAM1003 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1003 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1003 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1003 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1003 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13917] The complementary binding of GAM1003 RNA, herein designated GAM RNA, to target binding sites on GAM1003 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1003 target RNA, herein designated GAM TARGET RNA, into GAM1003 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13918] It is appreciated that GAM1003 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1003 target genes. The mRNA of each one of this plurality of GAM1003 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1003 RNA, herein designated GAM RNA, and which when bound by GAM1003 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1003 target proteins.

[13919] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1003 gene, herein designated GAM GENE, on one or more GAM1003 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13920] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1003 correlate with, and may be deduced from, the identity of the target

genes which GAM1003 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13921] Nucleotide sequences of the GAM1003 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1003 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1003 are further described hereinbelow with reference to Table 1.

[13922] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1003 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13923] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1004 (GAM1004) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13924] GAM1004 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1004 was detected is described hereinabove with reference to Figs. 2-8.

[13925] GAM1004 gene, herein designated GAM GENE, and GAM1004 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[13926] GAM1004 gene, herein designated GAM GENE, encodes a GAM1004 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1004 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1004 precursor RNA is designated SEQ ID:981, and is provided hereinbelow with reference to the sequence listing part.

[13927] GAM1004 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13928] An enzyme complex designated DICER COMPLEX, dices the GAM1004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1004 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1004 RNA is designated SEQ ID:3583, and is provided

hereinbelow with reference to the sequence listing part.

[13929] GAM1004 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1004 target RNA, herein designated GAM TARGET RNA. GAM1004 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13930] GAM1004 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1004 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1004 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1004 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1004 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13931] The complementary binding of GAM1004 RNA, herein designated GAM RNA, to target binding sites on GAM1004 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1004 target RNA, herein designated GAM TARGET RNA, into GAM1004 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13932] It is appreciated that GAM1004 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1004 target genes. The mRNA of each one of this plurality of GAM1004 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1004 RNA, herein designated GAM RNA, and which when bound by GAM1004 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1004 target proteins.

[13933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1004 gene, herein designated GAM GENE, on one or more GAM1004 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13934] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1004 correlate with, and may be deduced from, the identity of the target genes which GAM1004 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13935] Nucleotide sequences of the GAM1004 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1004 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1004 are further described hereinbelow with reference to Table 1.

[13936] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1004 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13937] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1005 (GAM1005) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13938] GAM1005 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1005 was detected is described hereinabove with reference to Figs. 2-8.

[13939] GAM1005 gene, herein designated GAM GENE, and GAM1005 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13940] GAM1005 gene, herein designated GAM GENE, encodes a GAM1005 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1005 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1005 precursor RNA is designated SEQ ID:982, and is provided hereinbelow with reference to the sequence listing part.

[13941] GAM1005 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1005 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13942] An enzyme complex designated DICER COMPLEX, dices the GAM1005 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1005 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1005 RNA is designated SEQ ID:3584, and is provided hereinbelow with reference to the sequence listing part.

[13943] GAM1005 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1005 target RNA, herein designated GAM TARGET RNA. GAM1005 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13944] GAM1005 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1005 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1005 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1005 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1005 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13945] The complementary binding of GAM1005 RNA, herein designated GAM RNA, to target binding sites on GAM1005 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1005 target RNA, herein designated GAM TARGET RNA, into GAM1005 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13946] It is appreciated that GAM1005 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1005 target genes. The mRNA of each one of this plurality of GAM1005 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1005 RNA, herein designated GAM RNA, and which when bound by GAM1005 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1005 target proteins.

[13947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1005 gene, herein designated GAM GENE, on one or more GAM1005 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13948] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1005 correlate with, and may be deduced from, the identity of the target genes which GAM1005 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13949] Nucleotide sequences of the GAM1005 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1005 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1005 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1005 are further described hereinbelow with reference to Table 1.

[13950] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1005 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13951] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1006 (GAM1006) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13952] GAM1006 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1006 was detected is described hereinabove with reference to Figs. 2-8.

[13953] GAM1006 gene, herein designated GAM GENE, and GAM1006 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13954] GAM1006 gene, herein designated GAM GENE, encodes a GAM1006 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1006 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1006 precursor RNA is designated SEQ ID:983, and is provided hereinbelow with reference to the sequence listing part.

[13955] GAM1006 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1006 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13956] An enzyme complex designated DICER COMPLEX, dices the GAM1006 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1006 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1006 RNA is designated SEQ ID:3585, and is provided hereinbelow with reference to the sequence listing part.

[13957] GAM1006 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1006 target RNA, herein designated GAM TARGET RNA. GAM1006 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13958] GAM1006 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1006 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1006 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1006 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1006 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13959] The complementary binding of GAM1006 RNA, herein designated GAM RNA, to target binding sites on GAM1006 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1006 target RNA, herein designated GAM TARGET RNA, into GAM1006 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13960] It is appreciated that GAM1006 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1006 target genes. The mRNA of each one of this plurality of GAM1006 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1006 RNA, herein designated GAM RNA, and which when bound by GAM1006 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1006 target proteins.

[13961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1006 gene, herein designated GAM GENE, on one or more GAM1006 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13962] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1006 correlate with, and may be deduced from, the identity of the target genes which GAM1006 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13963] Nucleotide sequences of the GAM1006 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1006 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1006 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1006 are further described hereinbelow with reference to Table 1.

[13964] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1006 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[13965] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1007 (GAM1007) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13966] GAM1007 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1007 was detected is described hereinabove with reference to Figs. 2-8.

[13967] GAM1007 gene, herein designated GAM GENE, and GAM1007 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13968] GAM1007 gene, herein designated GAM GENE, encodes a GAM1007 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1007 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1007 precursor RNA is designated SEQ ID:984, and is provided hereinbelow with reference to the sequence listing part.

[13969] GAM1007 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1007 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13970] An enzyme complex designated DICER COMPLEX, dices the GAM1007 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1007 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1007 RNA is designated SEQ ID:3586, and is provided hereinbelow with reference to the sequence listing part.

[13971] GAM1007 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1007 target RNA, herein designated GAM TARGET RNA. GAM1007 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13972] GAM1007 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1007 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1007 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1007 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1007 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13973] The complementary binding of GAM1007 RNA, herein designated GAM RNA, to target binding sites on GAM1007 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1007 target RNA, herein designated GAM TARGET RNA, into GAM1007 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13974] It is appreciated that GAM1007 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1007 target genes. The mRNA of each one of this plurality of GAM1007 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1007 RNA, herein designated GAM RNA, and which when bound by GAM1007 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1007 target proteins.

[13975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1007 gene, herein designated GAM GENE, on one or more GAM1007 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13976] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1007 correlate with, and may be deduced from, the identity of the target genes which GAM1007 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13977] Nucleotide sequences of the GAM1007 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1007 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1007 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1007 are further described hereinbelow with reference to Table 1.

[13978] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1007 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13979] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1008 (GAM1008) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13980] GAM1008 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1008 was detected is described hereinabove with reference to Figs. 2-8.

[13981] GAM1008 gene, herein designated GAM GENE, and GAM1008 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13982] GAM1008 gene, herein designated GAM GENE, encodes a GAM1008 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1008 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1008 precursor RNA is designated SEQ ID:985, and is provided hereinbelow with reference to the sequence listing part.

[13983] GAM1008 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13984] An enzyme complex designated DICER COMPLEX, dices the GAM1008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1008 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1008 RNA is designated SEQ ID:3587, and is provided hereinbelow with reference to the sequence listing part.

[13985] GAM1008 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1008 target RNA, herein designated GAM TARGET RNA. GAM1008 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13986] GAM1008 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1008 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1008 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1008 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1008 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13987] The complementary binding of GAM1008 RNA, herein designated GAM RNA, to target binding sites on GAM1008 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1008 target RNA, herein designated GAM TARGET RNA, into GAM1008 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13988] It is appreciated that GAM1008 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1008 target genes. The

mRNA of each one of this plurality of GAM1008 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1008 RNA, herein designated GAM RNA, and which when bound by GAM1008 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1008 target proteins.

[13989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1008 gene, herein designated GAM GENE, on one or more GAM1008 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13990] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1008 correlate with, and may be deduced from, the identity of the target genes which GAM1008 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13991] Nucleotide sequences of the GAM1008 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1008 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1008 are further described hereinbelow with reference to Table 1.

[13992] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1008 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[13993] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1009 (GAM1009) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13994] GAM1009 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1009 was detected is described hereinabove with reference to Figs. 2-8.

[13995] GAM1009 gene, herein designated GAM GENE, and GAM1009 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[13996] GAM1009 gene, herein designated GAM GENE, encodes a GAM1009 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1009 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1009 precursor RNA is designated SEQ ID:986, and is provided hereinbelow with reference to the sequence listing part.

[13997] GAM1009 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13998] An enzyme complex designated DICER COMPLEX, dices the GAM1009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1009 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1009 RNA is designated SEQ ID:3588, and is provided hereinbelow with reference to the sequence listing part.

[13999] GAM1009 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1009 target RNA, herein designated GAM TARGET RNA. GAM1009 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14000] GAM1009 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1009 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1009 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1009 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1009 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14001] The complementary binding of GAM1009 RNA, herein designated GAM RNA, to target binding sites on GAM1009 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1009 target RNA, herein designated GAM TARGET RNA, into GAM1009 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14002] It is appreciated that GAM1009 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1009 target genes. The mRNA of each one of this plurality of GAM1009 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1009 RNA, herein designated GAM RNA, and which when bound by GAM1009 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1009 target proteins.

[14003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1009 gene, herein designated GAM GENE, on one or more GAM1009 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14004] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1009 correlate with, and may be deduced from, the identity of the target

genes which GAM1009 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14005] Nucleotide sequences of the GAM1009 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1009 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1009 are further described hereinbelow with reference to Table 1.

[14006] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1009 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14007] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1010 (GAM1010) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14008] GAM1010 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1010 was detected is described hereinabove with reference to Figs. 2-8.

[14009] GAM1010 gene, herein designated GAM GENE, and GAM1010 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14010] GAM1010 gene, herein designated GAM GENE, encodes a GAM1010 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1010 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1010 precursor RNA is designated SEQ ID:987, and is provided hereinbelow with reference to the sequence listing part.

[14011] GAM1010 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14012] An enzyme complex designated DICER COMPLEX, dices the GAM1010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1010 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1010 RNA is designated SEQ ID:3589, and is provided

hereinbelow with reference to the sequence listing part.

[14013] GAM1010 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1010 target RNA, herein designated GAM TARGET RNA. GAM1010 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14014] GAM1010 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1010 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1010 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1010 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1010 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14015] The complementary binding of GAM1010 RNA, herein designated GAM RNA, to target binding sites on GAM1010 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1010 target RNA, herein designated GAM TARGET RNA, into GAM1010 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14016] It is appreciated that GAM1010 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1010 target genes. The mRNA of each one of this plurality of GAM1010 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1010 RNA, herein designated GAM RNA, and which when bound by GAM1010 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1010 target proteins.

[14017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1010 gene, herein designated GAM GENE, on one or more GAM1010 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14018] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1010 correlate with, and may be deduced from, the identity of the target genes which GAM1010 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14019] Nucleotide sequences of the GAM1010 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1010 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1010 are further described hereinbelow with reference to Table 1.

[14020] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1010 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14021] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1011 (GAM1011) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14022] GAM1011 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1011 was detected is described hereinabove with reference to Figs. 2-8.

[14023] GAM1011 gene, herein designated GAM GENE, and GAM1011 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14024] GAM1011 gene, herein designated GAM GENE, encodes a GAM1011 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1011 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1011 precursor RNA is designated SEQ ID:988, and is provided hereinbelow with reference to the sequence listing part.

[14025] GAM1011 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14026] An enzyme complex designated DICER COMPLEX, dices the GAM1011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1011 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1011 RNA is designated SEQ ID:3590, and is provided hereinbelow with reference to the sequence listing part.

[14027] GAM1011 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1011 target RNA, herein designated GAM TARGET RNA. GAM1011 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14028] GAM1011 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1011 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1011 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1011 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1011 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14029] The complementary binding of GAM1011 RNA, herein designated GAM RNA, to target binding sites on GAM1011 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1011 target RNA, herein designated GAM TARGET RNA, into GAM1011 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14030] It is appreciated that GAM1011 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1011 target genes. The mRNA of each one of this plurality of GAM1011 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1011 RNA, herein designated GAM RNA, and which when bound by GAM1011 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1011 target proteins.

[14031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1011 gene, herein designated GAM GENE, on one or more GAM1011 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14032] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1011 correlate with, and may be deduced from, the identity of the target genes which GAM1011 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14033] Nucleotide sequences of the GAM1011 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1011 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1011 are further described hereinbelow with reference to Table 1.

[14034] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1011 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14035] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1012 (GAM1012) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14036] GAM1012 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1012 was detected is described hereinabove with reference to Figs. 2-8.

[14037] GAM1012 gene, herein designated GAM GENE, and GAM1012 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14038] GAM1012 gene, herein designated GAM GENE, encodes a GAM1012 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1012 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1012 precursor RNA is designated SEQ ID:989, and is provided hereinbelow with reference to the sequence listing part.

[14039] GAM1012 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1012 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14040] An enzyme complex designated DICER COMPLEX, dices the GAM1012 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1012 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1012 RNA is designated SEQ ID:3591, and is provided hereinbelow with reference to the sequence listing part.

[14041] GAM1012 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1012 target RNA, herein designated GAM TARGET RNA. GAM1012 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14042] GAM1012 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1012 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1012 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1012 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1012 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14043] The complementary binding of GAM1012 RNA, herein designated GAM RNA, to target binding sites on GAM1012 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1012 target RNA, herein designated GAM TARGET RNA, into GAM1012 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14044] It is appreciated that GAM1012 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1012 target genes. The mRNA of each one of this plurality of GAM1012 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1012 RNA, herein designated GAM RNA, and which when bound by GAM1012 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1012 target proteins.

[14045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1012 gene, herein designated GAM GENE, on one or more GAM1012 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14046] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1012 correlate with, and may be deduced from, the identity of the target genes which GAM1012 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14047] Nucleotide sequences of the GAM1012 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1012 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1012 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1012 are further described hereinbelow with reference to Table 1.

[14048] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1012 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14049] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1013 (GAM1013) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14050] GAM1013 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1013 was detected is described hereinabove with reference to Figs. 2-8.

[14051] GAM1013 gene, herein designated GAM GENE, and GAM1013 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14052] GAM1013 gene, herein designated GAM GENE, encodes a GAM1013 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1013 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1013 precursor RNA is designated SEQ ID:990, and is provided hereinbelow with reference to the sequence listing part.

[14053] GAM1013 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14054] An enzyme complex designated DICER COMPLEX, dices the GAM1013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1013 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1013 RNA is designated SEQ ID:3592, and is provided hereinbelow with reference to the sequence listing part.

[14055] GAM1013 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1013 target RNA, herein designated GAM TARGET RNA. GAM1013 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14056] GAM1013 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1013 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1013 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1013 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1013 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14057] The complementary binding of GAM1013 RNA, herein designated GAM RNA, to target binding sites on GAM1013 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1013 target RNA, herein designated GAM TARGET RNA, into GAM1013 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14058] It is appreciated that GAM1013 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1013 target genes. The mRNA of each one of this plurality of GAM1013 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1013 RNA, herein designated GAM RNA, and which when bound by GAM1013 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1013 target proteins.

[14059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1013 gene, herein designated GAM GENE, on one or more GAM1013 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14060] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1013 correlate with, and may be deduced from, the identity of the target genes which GAM1013 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14061] Nucleotide sequences of the GAM1013 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1013 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1013 are further described hereinbelow with reference to Table 1.

[14062] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1013 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14063] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1014 (GAM1014) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14064] GAM1014 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1014 was detected is described hereinabove with reference to Figs. 2-8.

[14065] GAM1014 gene, herein designated GAM GENE, and GAM1014 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14066] GAM1014 gene, herein designated GAM GENE, encodes a GAM1014 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1014 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1014 precursor RNA is designated SEQ ID:991, and is provided hereinbelow with reference to the sequence listing part.

[14067] GAM1014 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14068] An enzyme complex designated DICER COMPLEX, dices the GAM1014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1014 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1014 RNA is designated SEQ ID:3593, and is provided hereinbelow with reference to the sequence listing part.

[14069] GAM1014 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1014 target RNA, herein designated GAM TARGET RNA. GAM1014 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14070] GAM1014 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1014 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1014 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1014 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1014 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14071] The complementary binding of GAM1014 RNA, herein designated GAM RNA, to target binding sites on GAM1014 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1014 target RNA, herein designated GAM TARGET RNA, into GAM1014 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14072] It is appreciated that GAM1014 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1014 target genes. The

mRNA of each one of this plurality of GAM1014 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1014 RNA, herein designated GAM RNA, and which when bound by GAM1014 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1014 target proteins.

[14073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1014 gene, herein designated GAM GENE, on one or more GAM1014 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14074] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1014 correlate with, and may be deduced from, the identity of the target genes which GAM1014 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14075] Nucleotide sequences of the GAM1014 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1014 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1014 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1014 are further described hereinbelow with reference to Table 1.

[14076] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1014 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14077] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1015 (GAM1015) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14078] GAM1015 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1015 was detected is described hereinabove with reference to Figs. 2-8.

[14079] GAM1015 gene, herein designated GAM GENE, and GAM1015 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14080] GAM1015 gene, herein designated GAM GENE, encodes a GAM1015 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1015 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1015 precursor RNA is designated SEQ ID:992, and is provided hereinbelow with reference to the sequence listing part.

[14081] GAM1015 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14082] An enzyme complex designated DICER COMPLEX, dices the GAM1015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1015 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1015 RNA is designated SEQ ID:3594, and is provided hereinbelow with reference to the sequence listing part.

[14083] GAM1015 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1015 target RNA, herein designated GAM TARGET RNA. GAM1015 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14084] GAM1015 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1015 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1015 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1015 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1015 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14085] The complementary binding of GAM1015 RNA, herein designated GAM RNA, to target binding sites on GAM1015 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1015 target RNA, herein designated GAM TARGET RNA, into GAM1015 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14086] It is appreciated that GAM1015 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1015 target genes. The mRNA of each one of this plurality of GAM1015 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1015 RNA, herein designated GAM RNA, and which when bound by GAM1015 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1015 target proteins.

[14087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1015 gene, herein designated GAM GENE, on one or more GAM1015 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14088] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1015 correlate with, and may be deduced from, the identity of the target

genes which GAM1015 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14089] Nucleotide sequences of the GAM1015 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1015 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1015 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1015 are further described hereinbelow with reference to Table 1.

[14090] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1015 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14091] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1016 (GAM1016) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14092] GAM1016 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1016 was detected is described hereinabove with reference to Figs. 2-8.

[14093] GAM1016 gene, herein designated GAM GENE, and GAM1016 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14094] GAM1016 gene, herein designated GAM GENE, encodes a GAM1016 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1016 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1016 precursor RNA is designated SEQ ID:993, and is provided hereinbelow with reference to the sequence listing part.

[14095] GAM1016 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14096] An enzyme complex designated DICER COMPLEX, dices the GAM1016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1016 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1016 RNA is designated SEQ ID:3595, and is provided

hereinbelow with reference to the sequence listing part.

[14097] GAM1016 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1016 target RNA, herein designated GAM TARGET RNA. GAM1016 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14098] GAM1016 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1016 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1016 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1016 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1016 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14099] The complementary binding of GAM1016 RNA, herein designated GAM RNA, to target binding sites on GAM1016 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1016 target RNA, herein designated GAM TARGET RNA, into GAM1016 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14100] It is appreciated that GAM1016 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1016 target genes. The mRNA of each one of this plurality of GAM1016 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1016 RNA, herein designated GAM RNA, and which when bound by GAM1016 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1016 target proteins.

[14101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1016 gene, herein designated GAM GENE, on one or more GAM1016 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14102] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1016 correlate with, and may be deduced from, the identity of the target genes which GAM1016 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14103] Nucleotide sequences of the GAM1016 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1016 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1016 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1016 are further described hereinbelow with reference to Table 1.

[14104] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1016 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14105] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1017 (GAM1017) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14106] GAM1017 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1017 was detected is described hereinabove with reference to Figs. 2-8.

[14107] GAM1017 gene, herein designated GAM GENE, and GAM1017 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14108] GAM1017 gene, herein designated GAM GENE, encodes a GAM1017 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1017 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1017 precursor RNA is designated SEQ ID:994, and is provided hereinbelow with reference to the sequence listing part.

[14109] GAM1017 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14110] An enzyme complex designated DICER COMPLEX, dices the GAM1017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1017 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1017 RNA is designated SEQ ID:3596, and is provided hereinbelow with reference to the sequence listing part.

[14111] GAM1017 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1017 target RNA, herein designated GAM TARGET RNA. GAM1017 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14112] GAM1017 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1017 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1017 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1017 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1017 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14113] The complementary binding of GAM1017 RNA, herein designated GAM RNA, to target binding sites on GAM1017 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1017 target RNA, herein designated GAM TARGET RNA, into GAM1017 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14114] It is appreciated that GAM1017 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1017 target genes. The mRNA of each one of this plurality of GAM1017 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1017 RNA, herein designated GAM RNA, and which when bound by GAM1017 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1017 target proteins.

[14115] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1017 gene, herein designated GAM GENE, on one or more GAM1017 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14116] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1017 correlate with, and may be deduced from, the identity of the target genes which GAM1017 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14117] Nucleotide sequences of the GAM1017 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1017 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1017 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1017 are further described hereinbelow with reference to Table 1.

[14118] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1017 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14119] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1018 (GAM1018) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14120] GAM1018 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1018 was detected is described hereinabove with reference to Figs. 2-8.

[14121] GAM1018 gene, herein designated GAM GENE, and GAM1018 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14122] GAM1018 gene, herein designated GAM GENE, encodes a GAM1018 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1018 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1018 precursor RNA is designated SEQ ID:995, and is provided hereinbelow with reference to the sequence listing part.

[14123] GAM1018 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14124] An enzyme complex designated DICER COMPLEX, dices the GAM1018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1018 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1018 RNA is designated SEQ ID:3598, and is provided hereinbelow with reference to the sequence listing part.

[14125] GAM1018 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1018 target RNA, herein designated GAM TARGET RNA. GAM1018 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14126] GAM1018 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1018 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1018 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1018 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1018 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14127] The complementary binding of GAM1018 RNA, herein designated GAM RNA, to target binding sites on GAM1018 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1018 target RNA, herein designated GAM TARGET RNA, into GAM1018 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14128] It is appreciated that GAM1018 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1018 target genes. The mRNA of each one of this plurality of GAM1018 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1018 RNA, herein designated GAM RNA, and which when bound by GAM1018 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1018 target proteins.

[14129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1018 gene, herein designated GAM GENE, on one or more GAM1018 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14130] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1018 correlate with, and may be deduced from, the identity of the target genes which GAM1018 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14131] Nucleotide sequences of the GAM1018 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1018 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1018 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1018 are further described hereinbelow with reference to Table 1.

[14132] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1018 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14133] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1019 (GAM1019) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14134] GAM1019 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1019 was detected is described hereinabove with reference to Figs. 2-8.

[14135] GAM1019 gene, herein designated GAM GENE, and GAM1019 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14136] GAM1019 gene, herein designated GAM GENE, encodes a GAM1019 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1019 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1019 precursor RNA is designated SEQ ID:996, and is provided hereinbelow with reference to the sequence listing part.

[14137] GAM1019 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14138] An enzyme complex designated DICER COMPLEX, dices the GAM1019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1019 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1019 RNA is designated SEQ ID:3597, and is provided hereinbelow with reference to the sequence listing part.

[14139] GAM1019 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1019 target RNA, herein designated GAM TARGET RNA. GAM1019 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14140] GAM1019 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1019 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1019 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1019 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1019 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14141] The complementary binding of GAM1019 RNA, herein designated GAM RNA, to target binding sites on GAM1019 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1019 target RNA, herein designated GAM TARGET RNA, into GAM1019 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14142] It is appreciated that GAM1019 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1019 target genes. The mRNA of each one of this plurality of GAM1019 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1019 RNA, herein designated GAM RNA, and which when bound by GAM1019 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1019 target proteins.

[14143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1019 gene, herein designated GAM GENE, on one or more GAM1019 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14144] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1019 correlate with, and may be deduced from, the identity of the target genes which GAM1019 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14145] Nucleotide sequences of the GAM1019 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1019 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1019 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1019 are further described hereinbelow with reference to Table 1.

[14146] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1019 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14147] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1020 (GAM1020) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14148] GAM1020 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1020 was detected is described hereinabove with reference to Figs. 2-8.

[14149] GAM1020 gene, herein designated GAM GENE, and GAM1020 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14150] GAM1020 gene, herein designated GAM GENE, encodes a GAM1020 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1020 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1020 precursor RNA is designated SEQ ID:997, and is provided hereinbelow with reference to the sequence listing part.

[14151] GAM1020 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14152] An enzyme complex designated DICER COMPLEX, dices the GAM1020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1020 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1020 RNA is designated SEQ ID:3600, and is provided hereinbelow with reference to the sequence listing part.

[14153] GAM1020 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1020 target RNA, herein designated GAM TARGET RNA. GAM1020 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14154] GAM1020 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1020 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1020 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1020 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1020 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14155] The complementary binding of GAM1020 RNA, herein designated GAM RNA, to target binding sites on GAM1020 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1020 target RNA, herein designated GAM TARGET RNA, into GAM1020 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14156] It is appreciated that GAM1020 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1020 target genes. The

mRNA of each one of this plurality of GAM1020 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1020 RNA, herein designated GAM RNA, and which when bound by GAM1020 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1020 target proteins.

[14157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1020 gene, herein designated GAM GENE, on one or more GAM1020 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14158] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1020 correlate with, and may be deduced from, the identity of the target genes which GAM1020 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14159] Nucleotide sequences of the GAM1020 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1020 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1020 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1020 are further described hereinbelow with reference to Table 1.

[14160] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1020 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14161] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1021 (GAM1021) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14162] GAM1021 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1021 was detected is described hereinabove with reference to Figs. 2-8.

[14163] GAM1021 gene, herein designated GAM GENE, and GAM1021 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14164] GAM1021 gene, herein designated GAM GENE, encodes a GAM1021 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1021 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1021 precursor RNA is designated SEQ ID:998, and is provided hereinbelow with reference to the sequence listing part.

[14165] GAM1021 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1021 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14166] An enzyme complex designated DICER COMPLEX, dices the GAM1021 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1021 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1021 RNA is designated SEQ ID:3599, and is provided hereinbelow with reference to the sequence listing part.

[14167] GAM1021 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1021 target RNA, herein designated GAM TARGET RNA. GAM1021 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14168] GAM1021 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1021 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1021 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1021 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1021 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14169] The complementary binding of GAM1021 RNA, herein designated GAM RNA, to target binding sites on GAM1021 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1021 target RNA, herein designated GAM TARGET RNA, into GAM1021 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14170] It is appreciated that GAM1021 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1021 target genes. The mRNA of each one of this plurality of GAM1021 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1021 RNA, herein designated GAM RNA, and which when bound by GAM1021 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1021 target proteins.

[14171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1021 gene, herein designated GAM GENE, on one or more GAM1021 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14172] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1021 correlate with, and may be deduced from, the identity of the target

genes which GAM1021 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14173] Nucleotide sequences of the GAM1021 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1021 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1021 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1021 are further described hereinbelow with reference to Table 1.

[14174] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1021 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14175] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1022 (GAM1022) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14176] GAM1022 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1022 was detected is described hereinabove with reference to Figs. 2-8.

[14177] GAM1022 gene, herein designated GAM GENE, and GAM1022 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14178] GAM1022 gene, herein designated GAM GENE, encodes a GAM1022 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1022 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1022 precursor RNA is designated SEQ ID:999, and is provided hereinbelow with reference to the sequence listing part.

[14179] GAM1022 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14180] An enzyme complex designated DICER COMPLEX, dices the GAM1022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1022 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1022 RNA is designated SEQ ID:3601, and is provided

hereinbelow with reference to the sequence listing part.

[14181] GAM1022 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1022 target RNA, herein designated GAM TARGET RNA. GAM1022 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14182] GAM1022 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1022 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1022 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1022 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1022 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14183] The complementary binding of GAM1022 RNA, herein designated GAM RNA, to target binding sites on GAM1022 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1022 target RNA, herein designated GAM TARGET RNA, into GAM1022 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14184] It is appreciated that GAM1022 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1022 target genes. The mRNA of each one of this plurality of GAM1022 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1022 RNA, herein designated GAM RNA, and which when bound by GAM1022 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1022 target proteins.

[14185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1022 gene, herein designated GAM GENE, on one or more GAM1022 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14186] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1022 correlate with, and may be deduced from, the identity of the target genes which GAM1022 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14187] Nucleotide sequences of the GAM1022 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1022 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1022 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1022 are further described hereinbelow with reference to Table 1.

[14188] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1022 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14189] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1023 (GAM1023) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14190] GAM1023 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1023 was detected is described hereinabove with reference to Figs. 2-8.

[14191] GAM1023 gene, herein designated GAM GENE, and GAM1023 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14192] GAM1023 gene, herein designated GAM GENE, encodes a GAM1023 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1023 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1023 precursor RNA is designated SEQ ID:1000, and is provided hereinbelow with reference to the sequence listing part.

[14193] GAM1023 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14194] An enzyme complex designated DICER COMPLEX, dices the GAM1023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1023 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1023 RNA is designated SEQ ID:3602, and is provided hereinbelow with reference to the sequence listing part.

[14195] GAM1023 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1023 target RNA, herein designated GAM TARGET RNA. GAM1023 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14196] GAM1023 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1023 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1023 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1023 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1023 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14197] The complementary binding of GAM1023 RNA, herein designated GAM RNA, to target binding sites on GAM1023 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1023 target RNA, herein designated GAM TARGET RNA, into GAM1023 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14198] It is appreciated that GAM1023 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1023 target genes. The mRNA of each one of this plurality of GAM1023 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1023 RNA, herein designated GAM RNA, and which when bound by GAM1023 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1023 target proteins.

[14199] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1023 gene, herein designated GAM GENE, on one or more GAM1023 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14200] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1023 correlate with, and may be deduced from, the identity of the target genes which GAM1023 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14201] Nucleotide sequences of the GAM1023 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1023 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1023 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1023 are further described hereinbelow with reference to Table 1.

[14202] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1023 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14203] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1024 (GAM1024) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14204] GAM1024 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1024 was detected is described hereinabove with reference to Figs. 2-8.

[14205] GAM1024 gene, herein designated GAM GENE, and GAM1024 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14206] GAM1024 gene, herein designated GAM GENE, encodes a GAM1024 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1024 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1024 precursor RNA is designated SEQ ID:1001, and is provided hereinbelow with reference to the sequence listing part.

[14207] GAM1024 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14208] An enzyme complex designated DICER COMPLEX, dices the GAM1024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1024 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1024 RNA is designated SEQ ID:3603, and is provided hereinbelow with reference to the sequence listing part.

[14209] GAM1024 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1024 target RNA, herein designated GAM TARGET RNA. GAM1024 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14210] GAM1024 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1024 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1024 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1024 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1024 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14211] The complementary binding of GAM1024 RNA, herein designated GAM RNA, to target binding sites on GAM1024 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1024 target RNA, herein designated GAM TARGET RNA, into GAM1024 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14212] It is appreciated that GAM1024 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1024 target genes. The mRNA of each one of this plurality of GAM1024 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1024 RNA, herein designated GAM RNA, and which when bound by GAM1024 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1024 target proteins.

[14213] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1024 gene, herein designated GAM GENE, on one or more GAM1024 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14214] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1024 correlate with, and may be deduced from, the identity of the target genes which GAM1024 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14215] Nucleotide sequences of the GAM1024 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1024 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1024 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1024 are further described hereinbelow with reference to Table 1.

[14216] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1024 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14217] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1025 (GAM1025) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14218] GAM1025 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1025 was detected is described hereinabove with reference to Figs. 2-8.

[14219] GAM1025 gene, herein designated GAM GENE, and GAM1025 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14220] GAM1025 gene, herein designated GAM GENE, encodes a GAM1025 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1025 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1025 precursor RNA is designated SEQ ID:1002, and is provided hereinbelow with reference to the sequence listing part.

[14221] GAM1025 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14222] An enzyme complex designated DICER COMPLEX, dices the GAM1025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1025 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1025 RNA is designated SEQ ID:3604, and is provided hereinbelow with reference to the sequence listing part.

[14223] GAM1025 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1025 target RNA, herein designated GAM TARGET RNA. GAM1025 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14224] GAM1025 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1025 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1025 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1025 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1025 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14225] The complementary binding of GAM1025 RNA, herein designated GAM RNA, to target binding sites on GAM1025 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1025 target RNA, herein designated GAM TARGET RNA, into GAM1025 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14226] It is appreciated that GAM1025 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1025 target genes. The mRNA of each one of this plurality of GAM1025 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1025 RNA, herein designated GAM RNA, and which when bound by GAM1025 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1025 target proteins.

[14227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1025 gene, herein designated GAM GENE, on one or more GAM1025 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14228] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1025 correlate with, and may be deduced from, the identity of the target genes which GAM1025 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14229] Nucleotide sequences of the GAM1025 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1025 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1025 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1025 are further described hereinbelow with reference to Table 1.

[14230] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1025 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14231] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1026 (GAM1026) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14232] GAM1026 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1026 was detected is described hereinabove with reference to Figs. 2-8.

[14233] GAM1026 gene, herein designated GAM GENE, and GAM1026 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14234] GAM1026 gene, herein designated GAM GENE, encodes a GAM1026 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1026 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1026 precursor RNA is designated SEQ ID:1003, and is provided hereinbelow with reference to the sequence listing part.

[14235] GAM1026 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1026 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14236] An enzyme complex designated DICER COMPLEX, dices the GAM1026 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1026 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1026 RNA is designated SEQ ID:3605, and is provided hereinbelow with reference to the sequence listing part.

[14237] GAM1026 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1026 target RNA, herein designated GAM TARGET RNA. GAM1026 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14238] GAM1026 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1026 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1026 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1026 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1026 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14239] The complementary binding of GAM1026 RNA, herein designated GAM RNA, to target binding sites on GAM1026 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1026 target RNA, herein designated GAM TARGET RNA, into GAM1026 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14240] It is appreciated that GAM1026 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1026 target genes. The

mRNA of each one of this plurality of GAM1026 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1026 RNA, herein designated GAM RNA, and which when bound by GAM1026 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1026 target proteins.

[14241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1026 gene, herein designated GAM GENE, on one or more GAM1026 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14242] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1026 correlate with, and may be deduced from, the identity of the target genes which GAM1026 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14243] Nucleotide sequences of the GAM1026 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1026 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1026 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1026 are further described hereinbelow with reference to Table 1.

[14244] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1026 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14245] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1027 (GAM1027) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14246] GAM1027 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1027 was detected is described hereinabove with reference to Figs. 2-8.

[14247] GAM1027 gene, herein designated GAM GENE, and GAM1027 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14248] GAM1027 gene, herein designated GAM GENE, encodes a GAM1027 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1027 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1027 precursor RNA is designated SEQ ID:1004, and is provided hereinbelow with reference to the sequence listing part.

[14249] GAM1027 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14250] An enzyme complex designated DICER COMPLEX, dices the GAM1027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1027 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1027 RNA is designated SEQ ID:3606, and is provided hereinbelow with reference to the sequence listing part.

[14251] GAM1027 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1027 target RNA, herein designated GAM TARGET RNA. GAM1027 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14252] GAM1027 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1027 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1027 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1027 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1027 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14253] The complementary binding of GAM1027 RNA, herein designated GAM RNA, to target binding sites on GAM1027 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1027 target RNA, herein designated GAM TARGET RNA, into GAM1027 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14254] It is appreciated that GAM1027 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1027 target genes. The mRNA of each one of this plurality of GAM1027 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1027 RNA, herein designated GAM RNA, and which when bound by GAM1027 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1027 target proteins.

[14255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1027 gene, herein designated GAM GENE, on one or more GAM1027 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14256] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1027 correlate with, and may be deduced from, the identity of the target

genes which GAM1027 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14257] Nucleotide sequences of the GAM1027 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1027 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1027 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1027 are further described hereinbelow with reference to Table 1.

[14258] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1027 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14259] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1028 (GAM1028) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14260] GAM1028 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1028 was detected is described hereinabove with reference to Figs. 2-8.

[14261] GAM1028 gene, herein designated GAM GENE, and GAM1028 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14262] GAM1028 gene, herein designated GAM GENE, encodes a GAM1028 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1028 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1028 precursor RNA is designated SEQ ID:1005, and is provided hereinbelow with reference to the sequence listing part.

[14263] GAM1028 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14264] An enzyme complex designated DICER COMPLEX, dices the GAM1028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1028 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1028 RNA is designated SEQ ID:3607, and is provided

hereinbelow with reference to the sequence listing part.

[14265] GAM1028 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1028 target RNA, herein designated GAM TARGET RNA. GAM1028 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14266] GAM1028 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1028 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1028 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1028 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1028 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14267] The complementary binding of GAM1028 RNA, herein designated GAM RNA, to target binding sites on GAM1028 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1028 target RNA, herein designated GAM TARGET RNA, into GAM1028 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14268] It is appreciated that GAM1028 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1028 target genes. The mRNA of each one of this plurality of GAM1028 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1028 RNA, herein designated GAM RNA, and which when bound by GAM1028 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1028 target proteins.

[14269] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1028 gene, herein designated GAM GENE, on one or more GAM1028 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14270] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1028 correlate with, and may be deduced from, the identity of the target genes which GAM1028 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14271] Nucleotide sequences of the GAM1028 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1028 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1028 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1028 are further described hereinbelow with reference to Table 1.

[14272] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1028 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14273] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1029 (GAM1029) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14274] GAM1029 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1029 was detected is described hereinabove with reference to Figs. 2-8.

[14275] GAM1029 gene, herein designated GAM GENE, and GAM1029 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14276] GAM1029 gene, herein designated GAM GENE, encodes a GAM1029 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1029 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1029 precursor RNA is designated SEQ ID:1006, and is provided hereinbelow with reference to the sequence listing part.

[14277] GAM1029 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14278] An enzyme complex designated DICER COMPLEX, dices the GAM1029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1029 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1029 RNA is designated SEQ ID:3608, and is provided hereinbelow with reference to the sequence listing part.

[14279] GAM1029 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1029 target RNA, herein designated GAM TARGET RNA. GAM1029 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14280] GAM1029 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1029 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1029 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1029 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1029 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14281] The complementary binding of GAM1029 RNA, herein designated GAM RNA, to target binding sites on GAM1029 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1029 target RNA, herein designated GAM TARGET RNA, into GAM1029 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14282] It is appreciated that GAM1029 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1029 target genes. The mRNA of each one of this plurality of GAM1029 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1029 RNA, herein designated GAM RNA, and which when bound by GAM1029 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1029 target proteins.

[14283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1029 gene, herein designated GAM GENE, on one or more GAM1029 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14284] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1029 correlate with, and may be deduced from, the identity of the target genes which GAM1029 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14285] Nucleotide sequences of the GAM1029 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1029 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1029 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1029 are further described hereinbelow with reference to Table 1.

[14286] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1029 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14287] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1030 (GAM1030) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14288] GAM1030 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1030 was detected is described hereinabove with reference to Figs. 2-8.

[14289] GAM1030 gene, herein designated GAM GENE, and GAM1030 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14290] GAM1030 gene, herein designated GAM GENE, encodes a GAM1030 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1030 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1030 precursor RNA is designated SEQ ID:1007, and is provided hereinbelow with reference to the sequence listing part.

[14291] GAM1030 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14292] An enzyme complex designated DICER COMPLEX, dices the GAM1030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1030 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1030 RNA is designated SEQ ID:3609, and is provided hereinbelow with reference to the sequence listing part.

[14293] GAM1030 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1030 target RNA, herein designated GAM TARGET RNA. GAM1030 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14294] GAM1030 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1030 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1030 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1030 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1030 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14295] The complementary binding of GAM1030 RNA, herein designated GAM RNA, to target binding sites on GAM1030 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1030 target RNA, herein designated GAM TARGET RNA, into GAM1030 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14296] It is appreciated that GAM1030 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1030 target genes. The mRNA of each one of this plurality of GAM1030 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1030 RNA, herein designated GAM RNA, and which when bound by GAM1030 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1030 target proteins.

[14297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1030 gene, herein designated GAM GENE, on one or more GAM1030 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14298] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1030 correlate with, and may be deduced from, the identity of the target genes which GAM1030 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14299] Nucleotide sequences of the GAM1030 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1030 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1030 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1030 are further described hereinbelow with reference to Table 1.

[14300] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1030 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14301] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1031 (GAM1031) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14302] GAM1031 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1031 was detected is described hereinabove with reference to Figs. 2-8.

[14303] GAM1031 gene, herein designated GAM GENE, and GAM1031 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14304] GAM1031 gene, herein designated GAM GENE, encodes a GAM1031 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1031 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1031 precursor RNA is designated SEQ ID:1008, and is provided hereinbelow with reference to the sequence listing part.

[14305] GAM1031 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14306] An enzyme complex designated DICER COMPLEX, dices the GAM1031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1031 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1031 RNA is designated SEQ ID:3610, and is provided hereinbelow with reference to the sequence listing part.

[14307] GAM1031 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1031 target RNA, herein designated GAM TARGET RNA. GAM1031 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14308] GAM1031 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1031 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1031 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1031 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1031 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14309] The complementary binding of GAM1031 RNA, herein designated GAM RNA, to target binding sites on GAM1031 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1031 target RNA, herein designated GAM TARGET RNA, into GAM1031 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14310] It is appreciated that GAM1031 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1031 target genes. The mRNA of each one of this plurality of GAM1031 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1031 RNA, herein designated GAM RNA, and which when bound by GAM1031 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1031 target proteins.

[14311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1031 gene, herein designated GAM GENE, on one or more GAM1031 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14312] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1031 correlate with, and may be deduced from, the identity of the target genes which GAM1031 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14313] Nucleotide sequences of the GAM1031 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1031 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1031 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1031 are further described hereinbelow with reference to Table 1.

[14314] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1031 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14315] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1032 (GAM1032) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14316] GAM1032 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1032 was detected is described hereinabove with reference to Figs. 2-8.

[14317] GAM1032 gene, herein designated GAM GENE, and GAM1032 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14318] GAM1032 gene, herein designated GAM GENE, encodes a GAM1032 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1032 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1032 precursor RNA is designated SEQ ID:1009, and is provided hereinbelow with reference to the sequence listing part.

[14319] GAM1032 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14320] An enzyme complex designated DICER COMPLEX, dices the GAM1032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1032 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1032 RNA is designated SEQ ID:3611, and is provided hereinbelow with reference to the sequence listing part.

[14321] GAM1032 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1032 target RNA, herein designated GAM TARGET RNA. GAM1032 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14322] GAM1032 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1032 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1032 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1032 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1032 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14323] The complementary binding of GAM1032 RNA, herein designated GAM RNA, to target binding sites on GAM1032 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1032 target RNA, herein designated GAM TARGET RNA, into GAM1032 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14324] It is appreciated that GAM1032 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1032 target genes. The

mRNA of each one of this plurality of GAM1032 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1032 RNA, herein designated GAM RNA, and which when bound by GAM1032 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1032 target proteins.

[14325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1032 gene, herein designated GAM GENE, on one or more GAM1032 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14326] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1032 correlate with, and may be deduced from, the identity of the target genes which GAM1032 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14327] Nucleotide sequences of the GAM1032 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1032 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1032 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1032 are further described hereinbelow with reference to Table 1.

[14328] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1032 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14329] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1033 (GAM1033) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14330] GAM1033 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1033 was detected is described hereinabove with reference to Figs. 2-8.

[14331] GAM1033 gene, herein designated GAM GENE, and GAM1033 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14332] GAM1033 gene, herein designated GAM GENE, encodes a GAM1033 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1033 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1033 precursor RNA is designated SEQ ID:1010, and is provided hereinbelow with reference to the sequence listing part.

[14333] GAM1033 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14334] An enzyme complex designated DICER COMPLEX, dices the GAM1033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1033 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM1033 RNA is designated SEQ ID:3612, and is provided hereinbelow with reference to the sequence listing part.

[14335] GAM1033 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1033 target RNA, herein designated GAM TARGET RNA. GAM1033 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14336] GAM1033 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1033 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1033 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1033 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1033 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14337] The complementary binding of GAM1033 RNA, herein designated GAM RNA, to target binding sites on GAM1033 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1033 target RNA, herein designated GAM TARGET RNA, into GAM1033 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14338] It is appreciated that GAM1033 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1033 target genes. The mRNA of each one of this plurality of GAM1033 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1033 RNA, herein designated GAM RNA, and which when bound by GAM1033 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1033 target proteins.

[14339] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1033 gene, herein designated GAM GENE, on one or more GAM1033 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14340] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1033 correlate with, and may be deduced from, the identity of the target

genes which GAM1033 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14341] Nucleotide sequences of the GAM1033 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1033 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1033 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1033 are further described hereinbelow with reference to Table 1.

[14342] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1033 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14343] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1034 (GAM1034) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14344] GAM1034 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1034 was detected is described hereinabove with reference to Figs. 2-8.

[14345] GAM1034 gene, herein designated GAM GENE, and GAM1034 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14346] GAM1034 gene, herein designated GAM GENE, encodes a GAM1034 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1034 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1034 precursor RNA is designated SEQ ID:1011, and is provided hereinbelow with reference to the sequence listing part.

[14347] GAM1034 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1034 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14348] An enzyme complex designated DICER COMPLEX, dices the GAM1034 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1034 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1034 RNA is designated SEQ ID:3613, and is provided

hereinbelow with reference to the sequence listing part.

[14349] GAM1034 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1034 target RNA, herein designated GAM TARGET RNA. GAM1034 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14350] GAM1034 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1034 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1034 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1034 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1034 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14351] The complementary binding of GAM1034 RNA, herein designated GAM RNA, to target binding sites on GAM1034 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1034 target RNA, herein designated GAM TARGET RNA, into GAM1034 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14352] It is appreciated that GAM1034 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1034 target genes. The mRNA of each one of this plurality of GAM1034 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1034 RNA, herein designated GAM RNA, and which when bound by GAM1034 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1034 target proteins.

[14353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1034 gene, herein designated GAM GENE, on one or more GAM1034 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14354] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1034 correlate with, and may be deduced from, the identity of the target genes which GAM1034 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14355] Nucleotide sequences of the GAM1034 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1034 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1034 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1034 are further described hereinbelow with reference to Table 1.

[14356] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1034 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14357] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1035 (GAM1035) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14358] GAM1035 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1035 was detected is described hereinabove with reference to Figs. 2-8.

[14359] GAM1035 gene, herein designated GAM GENE, and GAM1035 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14360] GAM1035 gene, herein designated GAM GENE, encodes a GAM1035 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1035 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1035 precursor RNA is designated SEQ ID:1012, and is provided hereinbelow with reference to the sequence listing part.

[14361] GAM1035 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14362] An enzyme complex designated DICER COMPLEX, dices the GAM1035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1035 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1035 RNA is designated SEQ ID:3614, and is provided hereinbelow with reference to the sequence listing part.

[14363] GAM1035 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1035 target RNA, herein designated GAM TARGET RNA. GAM1035 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14364] GAM1035 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1035 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1035 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1035 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1035 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14365] The complementary binding of GAM1035 RNA, herein designated GAM RNA, to target binding sites on GAM1035 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1035 target RNA, herein designated GAM TARGET RNA, into GAM1035 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14366] It is appreciated that GAM1035 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1035 target genes. The mRNA of each one of this plurality of GAM1035 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1035 RNA, herein designated GAM RNA, and which when bound by GAM1035 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1035 target proteins.

[14367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1035 gene, herein designated GAM GENE, on one or more GAM1035 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14368] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1035 correlate with, and may be deduced from, the identity of the target genes which GAM1035 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14369] Nucleotide sequences of the GAM1035 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1035 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1035 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1035 are further described hereinbelow with reference to Table 1.

[14370] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1035 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14371] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1036 (GAM1036) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14372] GAM1036 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1036 was detected is described hereinabove with reference to Figs. 2-8.

[14373] GAM1036 gene, herein designated GAM GENE, and GAM1036 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14374] GAM1036 gene, herein designated GAM GENE, encodes a GAM1036 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1036 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1036 precursor RNA is designated SEQ ID:1013, and is provided hereinbelow with reference to the sequence listing part.

[14375] GAM1036 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14376] An enzyme complex designated DICER COMPLEX, dices the GAM1036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1036 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1036 RNA is designated SEQ ID:3615, and is provided hereinbelow with reference to the sequence listing part.

[14377] GAM1036 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1036 target RNA, herein designated GAM TARGET RNA. GAM1036 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14378] GAM1036 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1036 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1036 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1036 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1036 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14379] The complementary binding of GAM1036 RNA, herein designated GAM RNA, to target binding sites on GAM1036 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1036 target RNA, herein designated GAM TARGET RNA, into GAM1036 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14380] It is appreciated that GAM1036 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1036 target genes. The mRNA of each one of this plurality of GAM1036 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1036 RNA, herein designated GAM RNA, and which when bound by GAM1036 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1036 target proteins.

[14381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1036 gene, herein designated GAM GENE, on one or more GAM1036 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14382] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1036 correlate with, and may be deduced from, the identity of the target genes which GAM1036 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14383] Nucleotide sequences of the GAM1036 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1036 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1036 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1036 are further described hereinbelow with reference to Table 1.

[14384] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1036 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14385] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1037 (GAM1037) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14386] GAM1037 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1037 was detected is described hereinabove with reference to Figs. 2-8.

[14387] GAM1037 gene, herein designated GAM GENE, and GAM1037 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14388] GAM1037 gene, herein designated GAM GENE, encodes a GAM1037 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1037 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1037 precursor RNA is designated SEQ ID:1014, and is provided hereinbelow with reference to the sequence listing part.

[14389] GAM1037 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14390] An enzyme complex designated DICER COMPLEX, dices the GAM1037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1037 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1037 RNA is designated SEQ ID:3616, and is provided hereinbelow with reference to the sequence listing part.

[14391] GAM1037 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1037 target RNA, herein designated GAM TARGET RNA. GAM1037 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14392] GAM1037 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1037 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1037 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1037 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1037 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14393] The complementary binding of GAM1037 RNA, herein designated GAM RNA, to target binding sites on GAM1037 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1037 target RNA, herein designated GAM TARGET RNA, into GAM1037 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14394] It is appreciated that GAM1037 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1037 target genes. The mRNA of each one of this plurality of GAM1037 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1037 RNA, herein designated GAM RNA, and which when bound by GAM1037 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1037 target proteins.

[14395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1037 gene, herein designated GAM GENE, on one or more GAM1037 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14396] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1037 correlate with, and may be deduced from, the identity of the target genes which GAM1037 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14397] Nucleotide sequences of the GAM1037 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1037 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1037 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1037 are further described hereinbelow with reference to Table 1.

[14398] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1037 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14399] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1038 (GAM1038) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14400] GAM1038 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1038 was detected is described hereinabove with reference to Figs. 2-8.

[14401] GAM1038 gene, herein designated GAM GENE, and GAM1038 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14402] GAM1038 gene, herein designated GAM GENE, encodes a GAM1038 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1038 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1038 precursor RNA is designated SEQ ID:1015, and is provided hereinbelow with reference to the sequence listing part.

[14403] GAM1038 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14404] An enzyme complex designated DICER COMPLEX, dices the GAM1038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1038 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1038 RNA is designated SEQ ID:3617, and is provided hereinbelow with reference to the sequence listing part.

[14405] GAM1038 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1038 target RNA, herein designated GAM TARGET RNA. GAM1038 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14406] GAM1038 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1038 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1038 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1038 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1038 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14407] The complementary binding of GAM1038 RNA, herein designated GAM RNA, to target binding sites on GAM1038 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1038 target RNA, herein designated GAM TARGET RNA, into GAM1038 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14408] It is appreciated that GAM1038 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1038 target genes. The

mRNA of each one of this plurality of GAM1038 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1038 RNA, herein designated GAM RNA, and which when bound by GAM1038 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1038 target proteins.

[14409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1038 gene, herein designated GAM GENE, on one or more GAM1038 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14410] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1038 correlate with, and may be deduced from, the identity of the target genes which GAM1038 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14411] Nucleotide sequences of the GAM1038 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1038 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1038 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1038 are further described hereinbelow with reference to Table 1.

[14412] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1038 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14413] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1039 (GAM1039) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14414] GAM1039 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1039 was detected is described hereinabove with reference to Figs. 2-8.

[14415] GAM1039 gene, herein designated GAM GENE, and GAM1039 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14416] GAM1039 gene, herein designated GAM GENE, encodes a GAM1039 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1039 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1039 precursor RNA is designated SEQ ID:1016, and is provided hereinbelow with reference to the sequence listing part.

[14417] GAM1039 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14418] An enzyme complex designated DICER COMPLEX, dices the GAM1039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1039 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1039 RNA is designated SEQ ID:3618, and is provided hereinbelow with reference to the sequence listing part.

[14419] GAM1039 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1039 target RNA, herein designated GAM TARGET RNA. GAM1039 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14420] GAM1039 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1039 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1039 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1039 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1039 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14421] The complementary binding of GAM1039 RNA, herein designated GAM RNA, to target binding sites on GAM1039 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1039 target RNA, herein designated GAM TARGET RNA, into GAM1039 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14422] It is appreciated that GAM1039 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1039 target genes. The mRNA of each one of this plurality of GAM1039 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1039 RNA, herein designated GAM RNA, and which when bound by GAM1039 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1039 target proteins.

[14423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1039 gene, herein designated GAM GENE, on one or more GAM1039 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14424] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1039 correlate with, and may be deduced from, the identity of the target

genes which GAM1039 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14425] Nucleotide sequences of the GAM1039 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1039 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1039 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1039 are further described hereinbelow with reference to Table 1.

[14426] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1039 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14427] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1040 (GAM1040) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14428] GAM1040 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1040 was detected is described hereinabove with reference to Figs. 2-8.

[14429] GAM1040 gene, herein designated GAM GENE, and GAM1040 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14430] GAM1040 gene, herein designated GAM GENE, encodes a GAM1040 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1040 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1040 precursor RNA is designated SEQ ID:1017, and is provided hereinbelow with reference to the sequence listing part.

[14431] GAM1040 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1040 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14432] An enzyme complex designated DICER COMPLEX, dices the GAM1040 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1040 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1040 RNA is designated SEQ ID:3619, and is provided

hereinbelow with reference to the sequence listing part.

[14433] GAM1040 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1040 target RNA, herein designated GAM TARGET RNA. GAM1040 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14434] GAM1040 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1040 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1040 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1040 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1040 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14435] The complementary binding of GAM1040 RNA, herein designated GAM RNA, to target binding sites on GAM1040 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1040 target RNA, herein designated GAM TARGET RNA, into GAM1040 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14436] It is appreciated that GAM1040 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1040 target genes. The mRNA of each one of this plurality of GAM1040 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1040 RNA, herein designated GAM RNA, and which when bound by GAM1040 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1040 target proteins.

[14437] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1040 gene, herein designated GAM GENE, on one or more GAM1040 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14438] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1040 correlate with, and may be deduced from, the identity of the target genes which GAM1040 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14439] Nucleotide sequences of the GAM1040 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1040 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1040 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1040 are further described hereinbelow with reference to Table 1.

[14440] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1040 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14441] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1041 (GAM1041) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14442] GAM1041 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1041 was detected is described hereinabove with reference to Figs. 2-8.

[14443] GAM1041 gene, herein designated GAM GENE, and GAM1041 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14444] GAM1041 gene, herein designated GAM GENE, encodes a GAM1041 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1041 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1041 precursor RNA is designated SEQ ID:1018, and is provided hereinbelow with reference to the sequence listing part.

[14445] GAM1041 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14446] An enzyme complex designated DICER COMPLEX, dices the GAM1041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1041 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1041 RNA is designated SEQ ID:3620, and is provided hereinbelow with reference to the sequence listing part.

[14447] GAM1041 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1041 target RNA, herein designated GAM TARGET RNA. GAM1041 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14448] GAM1041 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1041 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1041 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1041 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1041 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14449] The complementary binding of GAM1041 RNA, herein designated GAM RNA, to target binding sites on GAM1041 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1041 target RNA, herein designated GAM TARGET RNA, into GAM1041 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14450] It is appreciated that GAM1041 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1041 target genes. The mRNA of each one of this plurality of GAM1041 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1041 RNA, herein designated GAM RNA, and which when bound by GAM1041 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1041 target proteins.

[14451] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1041 gene, herein designated GAM GENE, on one or more GAM1041 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14452] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1041 correlate with, and may be deduced from, the identity of the target genes which GAM1041 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14453] Nucleotide sequences of the GAM1041 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1041 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1041 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1041 are further described hereinbelow with reference to Table 1.

[14454] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1041 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14455] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1042 (GAM1042) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14456] GAM1042 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1042 was detected is described hereinabove with reference to Figs. 2-8.

[14457] GAM1042 gene, herein designated GAM GENE, and GAM1042 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14458] GAM1042 gene, herein designated GAM GENE, encodes a GAM1042 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1042 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1042 precursor RNA is designated SEQ ID:1019, and is provided hereinbelow with reference to the sequence listing part.

[14459] GAM1042 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14460] An enzyme complex designated DICER COMPLEX, dices the GAM1042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1042 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1042 RNA is designated SEQ ID:3621, and is provided hereinbelow with reference to the sequence listing part.

[14461] GAM1042 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1042 target RNA, herein designated GAM TARGET RNA. GAM1042 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14462] GAM1042 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1042 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1042 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1042 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1042 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14463] The complementary binding of GAM1042 RNA, herein designated GAM RNA, to target binding sites on GAM1042 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1042 target RNA, herein designated GAM TARGET RNA, into GAM1042 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14464] It is appreciated that GAM1042 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1042 target genes. The mRNA of each one of this plurality of GAM1042 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1042 RNA, herein designated GAM RNA, and which when bound by GAM1042 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1042 target proteins.

[14465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1042 gene, herein designated GAM GENE, on one or more GAM1042 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14466] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1042 correlate with, and may be deduced from, the identity of the target genes which GAM1042 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14467] Nucleotide sequences of the GAM1042 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1042 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1042 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1042 are further described hereinbelow with reference to Table 1.

[14468] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1042 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14469] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1043 (GAM1043) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14470] GAM1043 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1043 was detected is described hereinabove with reference to Figs. 2-8.

[14471] GAM1043 gene, herein designated GAM GENE, and GAM1043 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14472] GAM1043 gene, herein designated GAM GENE, encodes a GAM1043 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1043 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1043 precursor RNA is designated SEQ ID:1020, and is provided hereinbelow with reference to the sequence listing part.

[14473] GAM1043 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14474] An enzyme complex designated DICER COMPLEX, dices the GAM1043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1043 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1043 RNA is designated SEQ ID:3622, and is provided hereinbelow with reference to the sequence listing part.

[14475] GAM1043 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1043 target RNA, herein designated GAM TARGET RNA. GAM1043 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14476] GAM1043 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1043 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1043 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1043 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1043 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14477] The complementary binding of GAM1043 RNA, herein designated GAM RNA, to target binding sites on GAM1043 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1043 target RNA, herein designated GAM TARGET RNA, into GAM1043 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14478] It is appreciated that GAM1043 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1043 target genes. The mRNA of each one of this plurality of GAM1043 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1043 RNA, herein designated GAM RNA, and which when bound by GAM1043 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1043 target proteins.

[14479] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1043 gene, herein designated GAM GENE, on one or more GAM1043 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14480] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1043 correlate with, and may be deduced from, the identity of the target genes which GAM1043 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14481] Nucleotide sequences of the GAM1043 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1043 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1043 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1043 are further described hereinbelow with reference to Table 1.

[14482] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1043 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14483] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1044 (GAM1044) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14484] GAM1044 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1044 was detected is described hereinabove with reference to Figs. 2-8.

[14485] GAM1044 gene, herein designated GAM GENE, and GAM1044 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14486] GAM1044 gene, herein designated GAM GENE, encodes a GAM1044 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1044 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1044 precursor RNA is designated SEQ ID:1021, and is provided hereinbelow with reference to the sequence listing part.

[14487] GAM1044 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1044 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14488] An enzyme complex designated DICER COMPLEX, dices the GAM1044 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1044 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1044 RNA is designated SEQ ID:3623, and is provided hereinbelow with reference to the sequence listing part.

[14489] GAM1044 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1044 target RNA, herein designated GAM TARGET RNA. GAM1044 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14490] GAM1044 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1044 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1044 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1044 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1044 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14491] The complementary binding of GAM1044 RNA, herein designated GAM RNA, to target binding sites on GAM1044 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1044 target RNA, herein designated GAM TARGET RNA, into GAM1044 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14492] It is appreciated that GAM1044 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1044 target genes. The

mRNA of each one of this plurality of GAM1044 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1044 RNA, herein designated GAM RNA, and which when bound by GAM1044 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1044 target proteins.

[14493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1044 gene, herein designated GAM GENE, on one or more GAM1044 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14494] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1044 correlate with, and may be deduced from, the identity of the target genes which GAM1044 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14495] Nucleotide sequences of the GAM1044 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1044 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1044 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1044 are further described hereinbelow with reference to Table 1.

[14496] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1044 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14497] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1045 (GAM1045) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14498] GAM1045 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1045 was detected is described hereinabove with reference to Figs. 2-8.

[14499] GAM1045 gene, herein designated GAM GENE, and GAM1045 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14500] GAM1045 gene, herein designated GAM GENE, encodes a GAM1045 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1045 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1045 precursor RNA is designated SEQ ID:1022, and is provided hereinbelow with reference to the sequence listing part.

[14501] GAM1045 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14502] An enzyme complex designated DICER COMPLEX, dices the GAM1045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1045 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1045 RNA is designated SEQ ID:3624, and is provided hereinbelow with reference to the sequence listing part.

[14503] GAM1045 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1045 target RNA, herein designated GAM TARGET RNA. GAM1045 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14504] GAM1045 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1045 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1045 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1045 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1045 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14505] The complementary binding of GAM1045 RNA, herein designated GAM RNA, to target binding sites on GAM1045 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1045 target RNA, herein designated GAM TARGET RNA, into GAM1045 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14506] It is appreciated that GAM1045 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1045 target genes. The mRNA of each one of this plurality of GAM1045 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1045 RNA, herein designated GAM RNA, and which when bound by GAM1045 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1045 target proteins.

[14507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1045 gene, herein designated GAM GENE, on one or more GAM1045 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14508] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1045 correlate with, and may be deduced from, the identity of the target

genes which GAM1045 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14509] Nucleotide sequences of the GAM1045 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1045 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1045 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1045 are further described hereinbelow with reference to Table 1.

[14510] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1045 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14511] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1046 (GAM1046) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14512] GAM1046 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1046 was detected is described hereinabove with reference to Figs. 2-8.

[14513] GAM1046 gene, herein designated GAM GENE, and GAM1046 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14514] GAM1046 gene, herein designated GAM GENE, encodes a GAM1046 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1046 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1046 precursor RNA is designated SEQ ID:1023, and is provided hereinbelow with reference to the sequence listing part.

[14515] GAM1046 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14516] An enzyme complex designated DICER COMPLEX, dices the GAM1046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1046 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1046 RNA is designated SEQ ID:3625, and is provided

hereinbelow with reference to the sequence listing part.

[14517] GAM1046 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1046 target RNA, herein designated GAM TARGET RNA. GAM1046 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14518] GAM1046 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1046 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1046 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1046 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1046 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14519] The complementary binding of GAM1046 RNA, herein designated GAM RNA, to target binding sites on GAM1046 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1046 target RNA, herein designated GAM TARGET RNA, into GAM1046 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14520] It is appreciated that GAM1046 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1046 target genes. The mRNA of each one of this plurality of GAM1046 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1046 RNA, herein designated GAM RNA, and which when bound by GAM1046 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1046 target proteins.

[14521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1046 gene, herein designated GAM GENE, on one or more GAM1046 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14522] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1046 correlate with, and may be deduced from, the identity of the target genes which GAM1046 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14523] Nucleotide sequences of the GAM1046 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1046 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1046 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1046 are further described hereinbelow with reference to Table 1.

[14524] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1046 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14525] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1047 (GAM1047) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14526] GAM1047 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1047 was detected is described hereinabove with reference to Figs. 2-8.

[14527] GAM1047 gene, herein designated GAM GENE, and GAM1047 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14528] GAM1047 gene, herein designated GAM GENE, encodes a GAM1047 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1047 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1047 precursor RNA is designated SEQ ID:1024, and is provided hereinbelow with reference to the sequence listing part.

[14529] GAM1047 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14530] An enzyme complex designated DICER COMPLEX, dices the GAM1047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1047 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1047 RNA is designated SEQ ID:3626, and is provided hereinbelow with reference to the sequence listing part.

[14531] GAM1047 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1047 target RNA, herein designated GAM TARGET RNA. GAM1047 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14532] GAM1047 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1047 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1047 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1047 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1047 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14533] The complementary binding of GAM1047 RNA, herein designated GAM RNA, to target binding sites on GAM1047 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1047 target RNA, herein designated GAM TARGET RNA, into GAM1047 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14534] It is appreciated that GAM1047 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1047 target genes. The mRNA of each one of this plurality of GAM1047 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1047 RNA, herein designated GAM RNA, and which when bound by GAM1047 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1047 target proteins.

[14535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1047 gene, herein designated GAM GENE, on one or more GAM1047 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14536] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1047 correlate with, and may be deduced from, the identity of the target genes which GAM1047 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14537] Nucleotide sequences of the GAM1047 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1047 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1047 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1047 are further described hereinbelow with reference to Table 1.

[14538] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1047 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14539] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1048 (GAM1048) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14540] GAM1048 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1048 was detected is described hereinabove with reference to Figs. 2-8.

[14541] GAM1048 gene, herein designated GAM GENE, and GAM1048 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14542] GAM1048 gene, herein designated GAM GENE, encodes a GAM1048 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1048 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1048 precursor RNA is designated SEQ ID:1025, and is provided hereinbelow with reference to the sequence listing part.

[14543] GAM1048 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14544] An enzyme complex designated DICER COMPLEX, dices the GAM1048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1048 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1048 RNA is designated SEQ ID:3627, and is provided hereinbelow with reference to the sequence listing part.

[14545] GAM1048 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1048 target RNA, herein designated GAM TARGET RNA. GAM1048 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14546] GAM1048 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1048 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1048 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1048 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1048 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14547] The complementary binding of GAM1048 RNA, herein designated GAM RNA, to target binding sites on GAM1048 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1048 target RNA, herein designated GAM TARGET RNA, into GAM1048 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14548] It is appreciated that GAM1048 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1048 target genes. The mRNA of each one of this plurality of GAM1048 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1048 RNA, herein designated GAM RNA, and which when bound by GAM1048 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1048 target proteins.

[14549] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1048 gene, herein designated GAM GENE, on one or more GAM1048 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14550] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1048 correlate with, and may be deduced from, the identity of the target genes which GAM1048 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14551] Nucleotide sequences of the GAM1048 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1048 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1048 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1048 are further described hereinbelow with reference to Table 1.

[14552] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1048 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14553] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1049 (GAM1049) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14554] GAM1049 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1049 was detected is described hereinabove with reference to Figs. 2-8.

[14555] GAM1049 gene, herein designated GAM GENE, and GAM1049 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14556] GAM1049 gene, herein designated GAM GENE, encodes a GAM1049 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1049 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1049 precursor RNA is designated SEQ ID:1026, and is provided hereinbelow with reference to the sequence listing part.

[14557] GAM1049 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1049 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14558] An enzyme complex designated DICER COMPLEX, dices the GAM1049 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1049 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1049 RNA is designated SEQ ID:3628, and is provided hereinbelow with reference to the sequence listing part.

[14559] GAM1049 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1049 target RNA, herein designated GAM TARGET RNA. GAM1049 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14560] GAM1049 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1049 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1049 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1049 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1049 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14561] The complementary binding of GAM1049 RNA, herein designated GAM RNA, to target binding sites on GAM1049 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1049 target RNA, herein designated GAM TARGET RNA, into GAM1049 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14562] It is appreciated that GAM1049 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1049 target genes. The mRNA of each one of this plurality of GAM1049 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1049 RNA, herein designated GAM RNA, and which when bound by GAM1049 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1049 target proteins.

[14563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1049 gene, herein designated GAM GENE, on one or more GAM1049 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14564] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1049 correlate with, and may be deduced from, the identity of the target genes which GAM1049 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14565] Nucleotide sequences of the GAM1049 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1049 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1049 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1049 are further described hereinbelow with reference to Table 1.

[14566] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1049 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14567] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1050 (GAM1050) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14568] GAM1050 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1050 was detected is described hereinabove with reference to Figs. 2-8.

[14569] GAM1050 gene, herein designated GAM GENE, and GAM1050 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14570] GAM1050 gene, herein designated GAM GENE, encodes a GAM1050 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1050 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1050 precursor RNA is designated SEQ ID:1027, and is provided hereinbelow with reference to the sequence listing part.

[14571] GAM1050 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1050 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14572] An enzyme complex designated DICER COMPLEX, dices the GAM1050 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1050 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1050 RNA is designated SEQ ID:3629, and is provided hereinbelow with reference to the sequence listing part.

[14573] GAM1050 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1050 target RNA, herein designated GAM TARGET RNA. GAM1050 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14574] GAM1050 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1050 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1050 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1050 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1050 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14575] The complementary binding of GAM1050 RNA, herein designated GAM RNA, to target binding sites on GAM1050 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1050 target RNA, herein designated GAM TARGET RNA, into GAM1050 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14576] It is appreciated that GAM1050 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1050 target genes. The

mRNA of each one of this plurality of GAM1050 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1050 RNA, herein designated GAM RNA, and which when bound by GAM1050 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1050 target proteins.

[14577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1050 gene, herein designated GAM GENE, on one or more GAM1050 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14578] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1050 correlate with, and may be deduced from, the identity of the target genes which GAM1050 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14579] Nucleotide sequences of the GAM1050 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1050 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1050 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1050 are further described hereinbelow with reference to Table 1.

[14580] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1050 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14581] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1051 (GAM1051) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14582] GAM1051 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1051 was detected is described hereinabove with reference to Figs. 2-8.

[14583] GAM1051 gene, herein designated GAM GENE, and GAM1051 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14584] GAM1051 gene, herein designated GAM GENE, encodes a GAM1051 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1051 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1051 precursor RNA is designated SEQ ID:1028, and is provided hereinbelow with reference to the sequence listing part.

[14585] GAM1051 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14586] An enzyme complex designated DICER COMPLEX, dices the GAM1051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1051 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1051 RNA is designated SEQ ID:3631, and is provided hereinbelow with reference to the sequence listing part.

[14587] GAM1051 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1051 target RNA, herein designated GAM TARGET RNA. GAM1051 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14588] GAM1051 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1051 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1051 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1051 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1051 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14589] The complementary binding of GAM1051 RNA, herein designated GAM RNA, to target binding sites on GAM1051 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1051 target RNA, herein designated GAM TARGET RNA, into GAM1051 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14590] It is appreciated that GAM1051 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1051 target genes. The mRNA of each one of this plurality of GAM1051 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1051 RNA, herein designated GAM RNA, and which when bound by GAM1051 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1051 target proteins.

[14591] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1051 gene, herein designated GAM GENE, on one or more GAM1051 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14592] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1051 correlate with, and may be deduced from, the identity of the target

genes which GAM1051 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14593] Nucleotide sequences of the GAM1051 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1051 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1051 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1051 are further described hereinbelow with reference to Table 1.

[14594] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1051 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14595] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1052 (GAM1052) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14596] GAM1052 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1052 was detected is described hereinabove with reference to Figs. 2-8.

[14597] GAM1052 gene, herein designated GAM GENE, and GAM1052 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14598] GAM1052 gene, herein designated GAM GENE, encodes a GAM1052 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1052 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1052 precursor RNA is designated SEQ ID:1029, and is provided hereinbelow with reference to the sequence listing part.

[14599] GAM1052 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14600] An enzyme complex designated DICER COMPLEX, dices the GAM1052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1052 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1052 RNA is designated SEQ ID:3632, and is provided

hereinbelow with reference to the sequence listing part.

[14601] GAM1052 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1052 target RNA, herein designated GAM TARGET RNA. GAM1052 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14602] GAM1052 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1052 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1052 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1052 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1052 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14603] The complementary binding of GAM1052 RNA, herein designated GAM RNA, to target binding sites on GAM1052 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1052 target RNA, herein designated GAM TARGET RNA, into GAM1052 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14604] It is appreciated that GAM1052 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1052 target genes. The mRNA of each one of this plurality of GAM1052 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1052 RNA, herein designated GAM RNA, and which when bound by GAM1052 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1052 target proteins.

[14605] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1052 gene, herein designated GAM GENE, on one or more GAM1052 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14606] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1052 correlate with, and may be deduced from, the identity of the target genes which GAM1052 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14607] Nucleotide sequences of the GAM1052 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1052 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1052 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1052 are further described hereinbelow with reference to Table 1.

[14608] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1052 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14609] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1053 (GAM1053) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14610] GAM1053 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1053 was detected is described hereinabove with reference to Figs. 2-8.

[14611] GAM1053 gene, herein designated GAM GENE, and GAM1053 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14612] GAM1053 gene, herein designated GAM GENE, encodes a GAM1053 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1053 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1053 precursor RNA is designated SEQ ID:1030, and is provided hereinbelow with reference to the sequence listing part.

[14613] GAM1053 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14614] An enzyme complex designated DICER COMPLEX, dices the GAM1053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1053 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1053 RNA is designated SEQ ID:3630, and is provided hereinbelow with reference to the sequence listing part.

[14615] GAM1053 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1053 target RNA, herein designated GAM TARGET RNA. GAM1053 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14616] GAM1053 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1053 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1053 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1053 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1053 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14617] The complementary binding of GAM1053 RNA, herein designated GAM RNA, to target binding sites on GAM1053 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1053 target RNA, herein designated GAM TARGET RNA, into GAM1053 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14618] It is appreciated that GAM1053 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1053 target genes. The mRNA of each one of this plurality of GAM1053 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1053 RNA, herein designated GAM RNA, and which when bound by GAM1053 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1053 target proteins.

[14619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1053 gene, herein designated GAM GENE, on one or more GAM1053 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14620] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1053 correlate with, and may be deduced from, the identity of the target genes which GAM1053 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14621] Nucleotide sequences of the GAM1053 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1053 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1053 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1053 are further described hereinbelow with reference to Table 1.

[14622] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1053 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14623] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1054 (GAM1054) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14624] GAM1054 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1054 was detected is described hereinabove with reference to Figs. 2-8.

[14625] GAM1054 gene, herein designated GAM GENE, and GAM1054 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14626] GAM1054 gene, herein designated GAM GENE, encodes a GAM1054 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1054 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1054 precursor RNA is designated SEQ ID:1031, and is provided hereinbelow with reference to the sequence listing part.

[14627] GAM1054 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1054 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14628] An enzyme complex designated DICER COMPLEX, dices the GAM1054 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1054 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1054 RNA is designated SEQ ID:3635, and is provided hereinbelow with reference to the sequence listing part.

[14629] GAM1054 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1054 target RNA, herein designated GAM TARGET RNA. GAM1054 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14630] GAM1054 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1054 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1054 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1054 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1054 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14631] The complementary binding of GAM1054 RNA, herein designated GAM RNA, to target binding sites on GAM1054 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1054 target RNA, herein designated GAM TARGET RNA, into GAM1054 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14632] It is appreciated that GAM1054 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1054 target genes. The mRNA of each one of this plurality of GAM1054 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1054 RNA, herein designated GAM RNA, and which when bound by GAM1054 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1054 target proteins.

[14633] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1054 gene, herein designated GAM GENE, on one or more GAM1054 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14634] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1054 correlate with, and may be deduced from, the identity of the target genes which GAM1054 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14635] Nucleotide sequences of the GAM1054 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1054 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1054 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1054 are further described hereinbelow with reference to Table 1.

[14636] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1054 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14637] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1055 (GAM1055) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14638] GAM1055 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1055 was detected is described hereinabove with reference to Figs. 2-8.

[14639] GAM1055 gene, herein designated GAM GENE, and GAM1055 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14640] GAM1055 gene, herein designated GAM GENE, encodes a GAM1055 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1055 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1055 precursor RNA is designated SEQ ID:1032, and is provided hereinbelow with reference to the sequence listing part.

[14641] GAM1055 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14642] An enzyme complex designated DICER COMPLEX, dices the GAM1055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1055 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1055 RNA is designated SEQ ID:3634, and is provided hereinbelow with reference to the sequence listing part.

[14643] GAM1055 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1055 target RNA, herein designated GAM TARGET RNA. GAM1055 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14644] GAM1055 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1055 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1055 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1055 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1055 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14645] The complementary binding of GAM1055 RNA, herein designated GAM RNA, to target binding sites on GAM1055 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1055 target RNA, herein designated GAM TARGET RNA, into GAM1055 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14646] It is appreciated that GAM1055 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1055 target genes. The mRNA of each one of this plurality of GAM1055 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1055 RNA, herein designated GAM RNA, and which when bound by GAM1055 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1055 target proteins.

[14647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1055 gene, herein designated GAM GENE, on one or more GAM1055 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14648] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1055 correlate with, and may be deduced from, the identity of the target genes which GAM1055 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14649] Nucleotide sequences of the GAM1055 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1055 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1055 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1055 are further described hereinbelow with reference to Table 1.

[14650] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1055 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14651] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1056 (GAM1056) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14652] GAM1056 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1056 was detected is described hereinabove with reference to Figs. 2-8.

[14653] GAM1056 gene, herein designated GAM GENE, and GAM1056 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14654] GAM1056 gene, herein designated GAM GENE, encodes a GAM1056 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1056 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1056 precursor RNA is designated SEQ ID:1033, and is provided hereinbelow with reference to the sequence listing part.

[14655] GAM1056 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14656] An enzyme complex designated DICER COMPLEX, dices the GAM1056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1056 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1056 RNA is designated SEQ ID:3633, and is provided hereinbelow with reference to the sequence listing part.

[14657] GAM1056 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1056 target RNA, herein designated GAM TARGET RNA. GAM1056 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14658] GAM1056 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1056 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1056 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1056 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1056 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14659] The complementary binding of GAM1056 RNA, herein designated GAM RNA, to target binding sites on GAM1056 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1056 target RNA, herein designated GAM TARGET RNA, into GAM1056 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14660] It is appreciated that GAM1056 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1056 target genes. The

mRNA of each one of this plurality of GAM1056 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1056 RNA, herein designated GAM RNA, and which when bound by GAM1056 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1056 target proteins.

[14661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1056 gene, herein designated GAM GENE, on one or more GAM1056 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14662] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1056 correlate with, and may be deduced from, the identity of the target genes which GAM1056 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14663] Nucleotide sequences of the GAM1056 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1056 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1056 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1056 are further described hereinbelow with reference to Table 1.

[14664] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1056 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14665] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1057 (GAM1057) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14666] GAM1057 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1057 was detected is described hereinabove with reference to Figs. 2-8.

[14667] GAM1057 gene, herein designated GAM GENE, and GAM1057 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14668] GAM1057 gene, herein designated GAM GENE, encodes a GAM1057 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1057 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1057 precursor RNA is designated SEQ ID:1034, and is provided hereinbelow with reference to the sequence listing part.

[14669] GAM1057 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14670] An enzyme complex designated DICER COMPLEX, dices the GAM1057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1057 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1057 RNA is designated SEQ ID:3636, and is provided hereinbelow with reference to the sequence listing part.

[14671] GAM1057 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1057 target RNA, herein designated GAM TARGET RNA. GAM1057 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14672] GAM1057 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1057 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1057 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1057 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1057 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14673] The complementary binding of GAM1057 RNA, herein designated GAM RNA, to target binding sites on GAM1057 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1057 target RNA, herein designated GAM TARGET RNA, into GAM1057 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14674] It is appreciated that GAM1057 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1057 target genes. The mRNA of each one of this plurality of GAM1057 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1057 RNA, herein designated GAM RNA, and which when bound by GAM1057 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1057 target proteins.

[14675] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1057 gene, herein designated GAM GENE, on one or more GAM1057 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14676] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1057 correlate with, and may be deduced from, the identity of the target

genes which GAM1057 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14677] Nucleotide sequences of the GAM1057 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1057 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1057 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1057 are further described hereinbelow with reference to Table 1.

[14678] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1057 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14679] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1058 (GAM1058) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14680] GAM1058 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1058 was detected is described hereinabove with reference to Figs. 2-8.

[14681] GAM1058 gene, herein designated GAM GENE, and GAM1058 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14682] GAM1058 gene, herein designated GAM GENE, encodes a GAM1058 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1058 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1058 precursor RNA is designated SEQ ID:1035, and is provided hereinbelow with reference to the sequence listing part.

[14683] GAM1058 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14684] An enzyme complex designated DICER COMPLEX, dices the GAM1058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1058 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1058 RNA is designated SEQ ID:3637, and is provided

hereinbelow with reference to the sequence listing part.

[14685] GAM1058 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1058 target RNA, herein designated GAM TARGET RNA. GAM1058 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14686] GAM1058 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1058 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1058 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1058 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1058 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14687] The complementary binding of GAM1058 RNA, herein designated GAM RNA, to target binding sites on GAM1058 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1058 target RNA, herein designated GAM TARGET RNA, into GAM1058 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14688] It is appreciated that GAM1058 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1058 target genes. The mRNA of each one of this plurality of GAM1058 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1058 RNA, herein designated GAM RNA, and which when bound by GAM1058 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1058 target proteins.

[14689] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1058 gene, herein designated GAM GENE, on one or more GAM1058 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14690] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1058 correlate with, and may be deduced from, the identity of the target genes which GAM1058 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14691] Nucleotide sequences of the GAM1058 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1058 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1058 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1058 are further described hereinbelow with reference to Table 1.

[14692] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1058 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14693] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1059 (GAM1059) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14694] GAM1059 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1059 was detected is described hereinabove with reference to Figs. 2-8.

[14695] GAM1059 gene, herein designated GAM GENE, and GAM1059 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14696] GAM1059 gene, herein designated GAM GENE, encodes a GAM1059 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1059 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1059 precursor RNA is designated SEQ ID:1036, and is provided hereinbelow with reference to the sequence listing part.

[14697] GAM1059 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14698] An enzyme complex designated DICER COMPLEX, dices the GAM1059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1059 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1059 RNA is designated SEQ ID:3638, and is provided hereinbelow with reference to the sequence listing part.

[14699] GAM1059 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1059 target RNA, herein designated GAM TARGET RNA. GAM1059 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14700] GAM1059 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1059 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1059 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1059 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1059 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14701] The complementary binding of GAM1059 RNA, herein designated GAM RNA, to target binding sites on GAM1059 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1059 target RNA, herein designated GAM TARGET RNA, into GAM1059 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14702] It is appreciated that GAM1059 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1059 target genes. The mRNA of each one of this plurality of GAM1059 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1059 RNA, herein designated GAM RNA, and which when bound by GAM1059 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1059 target proteins.

[14703] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1059 gene, herein designated GAM GENE, on one or more GAM1059 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14704] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1059 correlate with, and may be deduced from, the identity of the target genes which GAM1059 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14705] Nucleotide sequences of the GAM1059 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1059 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1059 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1059 are further described hereinbelow with reference to Table 1.

[14706] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1059 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14707] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1060 (GAM1060) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14708] GAM1060 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1060 was detected is described hereinabove with reference to Figs. 2-8.

[14709] GAM1060 gene, herein designated GAM GENE, and GAM1060 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14710] GAM1060 gene, herein designated GAM GENE, encodes a GAM1060 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1060 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1060 precursor RNA is designated SEQ ID:1037, and is provided hereinbelow with reference to the sequence listing part.

[14711] GAM1060 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14712] An enzyme complex designated DICER COMPLEX, dices the GAM1060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1060 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1060 RNA is designated SEQ ID:3640, and is provided hereinbelow with reference to the sequence listing part.

[14713] GAM1060 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1060 target RNA, herein designated GAM TARGET RNA. GAM1060 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14714] GAM1060 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1060 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1060 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1060 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1060 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14715] The complementary binding of GAM1060 RNA, herein designated GAM RNA, to target binding sites on GAM1060 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1060 target RNA, herein designated GAM TARGET RNA, into GAM1060 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14716] It is appreciated that GAM1060 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1060 target genes. The mRNA of each one of this plurality of GAM1060 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1060 RNA, herein designated GAM RNA, and which when bound by GAM1060 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1060 target proteins.

[14717] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1060 gene, herein designated GAM GENE, on one or more GAM1060 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14718] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1060 correlate with, and may be deduced from, the identity of the target genes which GAM1060 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14719] Nucleotide sequences of the GAM1060 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1060 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1060 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1060 are further described hereinbelow with reference to Table 1.

[14720] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1060 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14721] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1061 (GAM1061) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14722] GAM1061 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1061 was detected is described hereinabove with reference to Figs. 2-8.

[14723] GAM1061 gene, herein designated GAM GENE, and GAM1061 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14724] GAM1061 gene, herein designated GAM GENE, encodes a GAM1061 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1061 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1061 precursor RNA is designated SEQ ID:1038, and is provided hereinbelow with reference to the sequence listing part.

[14725] GAM1061 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14726] An enzyme complex designated DICER COMPLEX, dices the GAM1061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1061 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1061 RNA is designated SEQ ID:3639, and is provided hereinbelow with reference to the sequence listing part.

[14727] GAM1061 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1061 target RNA, herein designated GAM TARGET RNA. GAM1061 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14728] GAM1061 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1061 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1061 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1061 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1061 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14729] The complementary binding of GAM1061 RNA, herein designated GAM RNA, to target binding sites on GAM1061 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1061 target RNA, herein designated GAM TARGET RNA, into GAM1061 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14730] It is appreciated that GAM1061 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1061 target genes. The mRNA of each one of this plurality of GAM1061 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1061 RNA, herein designated GAM RNA, and which when bound by GAM1061 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1061 target proteins.

[14731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1061 gene, herein designated GAM GENE, on one or more GAM1061 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14732] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1061 correlate with, and may be deduced from, the identity of the target genes which GAM1061 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14733] Nucleotide sequences of the GAM1061 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1061 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1061 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1061 are further described hereinbelow with reference to Table 1.

[14734] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1061 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14735] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1062 (GAM1062) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14736] GAM1062 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1062 was detected is described hereinabove with reference to Figs. 2-8.

[14737] GAM1062 gene, herein designated GAM GENE, and GAM1062 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14738] GAM1062 gene, herein designated GAM GENE, encodes a GAM1062 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1062 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1062 precursor RNA is designated SEQ ID:1039, and is provided hereinbelow with reference to the sequence listing part.

[14739] GAM1062 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14740] An enzyme complex designated DICER COMPLEX, dices the GAM1062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1062 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1062 RNA is designated SEQ ID:3641, and is provided hereinbelow with reference to the sequence listing part.

[14741] GAM1062 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1062 target RNA, herein designated GAM TARGET RNA. GAM1062 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14742] GAM1062 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1062 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1062 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1062 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1062 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14743] The complementary binding of GAM1062 RNA, herein designated GAM RNA, to target binding sites on GAM1062 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1062 target RNA, herein designated GAM TARGET RNA, into GAM1062 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14744] It is appreciated that GAM1062 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1062 target genes. The

mRNA of each one of this plurality of GAM1062 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1062 RNA, herein designated GAM RNA, and which when bound by GAM1062 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1062 target proteins.

[14745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1062 gene, herein designated GAM GENE, on one or more GAM1062 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14746] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1062 correlate with, and may be deduced from, the identity of the target genes which GAM1062 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14747] Nucleotide sequences of the GAM1062 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1062 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1062 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1062 are further described hereinbelow with reference to Table 1.

[14748] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1062 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14749] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1063 (GAM1063) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14750] GAM1063 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1063 was detected is described hereinabove with reference to Figs. 2-8.

[14751] GAM1063 gene, herein designated GAM GENE, and GAM1063 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14752] GAM1063 gene, herein designated GAM GENE, encodes a GAM1063 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1063 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1063 precursor RNA is designated SEQ ID:1040, and is provided hereinbelow with reference to the sequence listing part.

[14753] GAM1063 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14754] An enzyme complex designated DICER COMPLEX, dices the GAM1063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1063 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1063 RNA is designated SEQ ID:3642, and is provided hereinbelow with reference to the sequence listing part.

[14755] GAM1063 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1063 target RNA, herein designated GAM TARGET RNA. GAM1063 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14756] GAM1063 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1063 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1063 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1063 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1063 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14757] The complementary binding of GAM1063 RNA, herein designated GAM RNA, to target binding sites on GAM1063 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1063 target RNA, herein designated GAM TARGET RNA, into GAM1063 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14758] It is appreciated that GAM1063 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1063 target genes. The mRNA of each one of this plurality of GAM1063 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1063 RNA, herein designated GAM RNA, and which when bound by GAM1063 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1063 target proteins.

[14759] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1063 gene, herein designated GAM GENE, on one or more GAM1063 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14760] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1063 correlate with, and may be deduced from, the identity of the target

genes which GAM1063 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14761] Nucleotide sequences of the GAM1063 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1063 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1063 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1063 are further described hereinbelow with reference to Table 1.

[14762] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1063 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14763] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1064 (GAM1064) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14764] GAM1064 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1064 was detected is described hereinabove with reference to Figs. 2-8.

[14765] GAM1064 gene, herein designated GAM GENE, and GAM1064 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14766] GAM1064 gene, herein designated GAM GENE, encodes a GAM1064 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1064 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1064 precursor RNA is designated SEQ ID:1041, and is provided hereinbelow with reference to the sequence listing part.

[14767] GAM1064 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14768] An enzyme complex designated DICER COMPLEX, dices the GAM1064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1064 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1064 RNA is designated SEQ ID:3643, and is provided

hereinbelow with reference to the sequence listing part.

[14769] GAM1064 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1064 target RNA, herein designated GAM TARGET RNA. GAM1064 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14770] GAM1064 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1064 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1064 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1064 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1064 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14771] The complementary binding of GAM1064 RNA, herein designated GAM RNA, to target binding sites on GAM1064 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1064 target RNA, herein designated GAM TARGET RNA, into GAM1064 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14772] It is appreciated that GAM1064 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1064 target genes. The mRNA of each one of this plurality of GAM1064 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1064 RNA, herein designated GAM RNA, and which when bound by GAM1064 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1064 target proteins.

[14773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1064 gene, herein designated GAM GENE, on one or more GAM1064 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14774] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1064 correlate with, and may be deduced from, the identity of the target genes which GAM1064 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14775] Nucleotide sequences of the GAM1064 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1064 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1064 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1064 are further described hereinbelow with reference to Table 1.

[14776] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1064 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14777] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1065 (GAM1065) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14778] GAM1065 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1065 was detected is described hereinabove with reference to Figs. 2-8.

[14779] GAM1065 gene, herein designated GAM GENE, and GAM1065 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14780] GAM1065 gene, herein designated GAM GENE, encodes a GAM1065 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1065 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1065 precursor RNA is designated SEQ ID:1042, and is provided hereinbelow with reference to the sequence listing part.

[14781] GAM1065 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14782] An enzyme complex designated DICER COMPLEX, dices the GAM1065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1065 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1065 RNA is designated SEQ ID:3644, and is provided hereinbelow with reference to the sequence listing part.

[14783] GAM1065 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1065 target RNA, herein designated GAM TARGET RNA. GAM1065 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14784] GAM1065 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1065 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1065 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1065 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1065 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14785] The complementary binding of GAM1065 RNA, herein designated GAM RNA, to target binding sites on GAM1065 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1065 target RNA, herein designated GAM TARGET RNA, into GAM1065 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14786] It is appreciated that GAM1065 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1065 target genes. The mRNA of each one of this plurality of GAM1065 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1065 RNA, herein designated GAM RNA, and which when bound by GAM1065 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1065 target proteins.

[14787] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1065 gene, herein designated GAM GENE, on one or more GAM1065 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14788] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1065 correlate with, and may be deduced from, the identity of the target genes which GAM1065 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14789] Nucleotide sequences of the GAM1065 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1065 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1065 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1065 are further described hereinbelow with reference to Table 1.

[14790] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1065 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14791] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1066 (GAM1066) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14792] GAM1066 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1066 was detected is described hereinabove with reference to Figs. 2-8.

[14793] GAM1066 gene, herein designated GAM GENE, and GAM1066 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14794] GAM1066 gene, herein designated GAM GENE, encodes a GAM1066 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1066 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1066 precursor RNA is designated SEQ ID:1043, and is provided hereinbelow with reference to the sequence listing part.

[14795] GAM1066 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14796] An enzyme complex designated DICER COMPLEX, dices the GAM1066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1066 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1066 RNA is designated SEQ ID:3645, and is provided hereinbelow with reference to the sequence listing part.

[14797] GAM1066 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1066 target RNA, herein designated GAM TARGET RNA. GAM1066 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14798] GAM1066 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1066 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1066 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1066 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1066 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14799] The complementary binding of GAM1066 RNA, herein designated GAM RNA, to target binding sites on GAM1066 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1066 target RNA, herein designated GAM TARGET RNA, into GAM1066 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14800] It is appreciated that GAM1066 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1066 target genes. The mRNA of each one of this plurality of GAM1066 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1066 RNA, herein designated GAM RNA, and which when bound by GAM1066 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1066 target proteins.

[14801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1066 gene, herein designated GAM GENE, on one or more GAM1066 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14802] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1066 correlate with, and may be deduced from, the identity of the target genes which GAM1066 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14803] Nucleotide sequences of the GAM1066 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1066 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1066 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1066 are further described hereinbelow with reference to Table 1.

[14804] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1066 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14805] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1067 (GAM1067) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14806] GAM1067 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1067 was detected is described hereinabove with reference to Figs. 2-8.

[14807] GAM1067 gene, herein designated GAM GENE, and GAM1067 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14808] GAM1067 gene, herein designated GAM GENE, encodes a GAM1067 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1067 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1067 precursor RNA is designated SEQ ID:1044, and is provided hereinbelow with reference to the sequence listing part.

[14809] GAM1067 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1067 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14810] An enzyme complex designated DICER COMPLEX, dices the GAM1067 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1067 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1067 RNA is designated SEQ ID:3646, and is provided hereinbelow with reference to the sequence listing part.

[14811] GAM1067 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1067 target RNA, herein designated GAM TARGET RNA. GAM1067 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14812] GAM1067 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1067 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1067 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1067 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1067 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14813] The complementary binding of GAM1067 RNA, herein designated GAM RNA, to target binding sites on GAM1067 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1067 target RNA, herein designated GAM TARGET RNA, into GAM1067 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14814] It is appreciated that GAM1067 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1067 target genes. The mRNA of each one of this plurality of GAM1067 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1067 RNA, herein designated GAM RNA, and which when bound by GAM1067 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1067 target proteins.

[14815] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1067 gene, herein designated GAM GENE, on one or more GAM1067 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14816] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1067 correlate with, and may be deduced from, the identity of the target genes which GAM1067 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14817] Nucleotide sequences of the GAM1067 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1067 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1067 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1067 are further described hereinbelow with reference to Table 1.

[14818] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1067 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14819] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1068 (GAM1068) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14820] GAM1068 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1068 was detected is described hereinabove with reference to Figs. 2-8.

[14821] GAM1068 gene, herein designated GAM GENE, and GAM1068 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14822] GAM1068 gene, herein designated GAM GENE, encodes a GAM1068 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1068 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1068 precursor RNA is designated SEQ ID:1045, and is provided hereinbelow with reference to the sequence listing part.

[14823] GAM1068 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14824] An enzyme complex designated DICER COMPLEX, dices the GAM1068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1068 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1068 RNA is designated SEQ ID:3647, and is provided hereinbelow with reference to the sequence listing part.

[14825] GAM1068 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1068 target RNA, herein designated GAM TARGET RNA. GAM1068 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14826] GAM1068 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1068 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1068 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1068 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1068 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14827] The complementary binding of GAM1068 RNA, herein designated GAM RNA, to target binding sites on GAM1068 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1068 target RNA, herein designated GAM TARGET RNA, into GAM1068 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14828] It is appreciated that GAM1068 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1068 target genes. The

mRNA of each one of this plurality of GAM1068 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1068 RNA, herein designated GAM RNA, and which when bound by GAM1068 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1068 target proteins.

[14829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1068 gene, herein designated GAM GENE, on one or more GAM1068 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14830] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1068 correlate with, and may be deduced from, the identity of the target genes which GAM1068 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14831] Nucleotide sequences of the GAM1068 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1068 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1068 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1068 are further described hereinbelow with reference to Table 1.

[14832] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1068 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14833] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1069 (GAM1069) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14834] GAM1069 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1069 was detected is described hereinabove with reference to Figs. 2-8.

[14835] GAM1069 gene, herein designated GAM GENE, and GAM1069 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14836] GAM1069 gene, herein designated GAM GENE, encodes a GAM1069 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1069 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1069 precursor RNA is designated SEQ ID:1046, and is provided hereinbelow with reference to the sequence listing part.

[14837] GAM1069 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14838] An enzyme complex designated DICER COMPLEX, dices the GAM1069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1069 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1069 RNA is designated SEQ ID:3648, and is provided hereinbelow with reference to the sequence listing part.

[14839] GAM1069 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1069 target RNA, herein designated GAM TARGET RNA. GAM1069 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14840] GAM1069 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1069 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1069 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1069 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1069 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14841] The complementary binding of GAM1069 RNA, herein designated GAM RNA, to target binding sites on GAM1069 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1069 target RNA, herein designated GAM TARGET RNA, into GAM1069 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14842] It is appreciated that GAM1069 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1069 target genes. The mRNA of each one of this plurality of GAM1069 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1069 RNA, herein designated GAM RNA, and which when bound by GAM1069 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1069 target proteins.

[14843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1069 gene, herein designated GAM GENE, on one or more GAM1069 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14844] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1069 correlate with, and may be deduced from, the identity of the target

genes which GAM1069 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14845] Nucleotide sequences of the GAM1069 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1069 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1069 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1069 are further described hereinbelow with reference to Table 1.

[14846] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1069 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14847] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1070 (GAM1070) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14848] GAM1070 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1070 was detected is described hereinabove with reference to Figs. 2-8.

[14849] GAM1070 gene, herein designated GAM GENE, and GAM1070 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14850] GAM1070 gene, herein designated GAM GENE, encodes a GAM1070 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1070 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1070 precursor RNA is designated SEQ ID:1047, and is provided hereinbelow with reference to the sequence listing part.

[14851] GAM1070 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14852] An enzyme complex designated DICER COMPLEX, dices the GAM1070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1070 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1070 RNA is designated SEQ ID:3650, and is provided

hereinbelow with reference to the sequence listing part.

[14853] GAM1070 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1070 target RNA, herein designated GAM TARGET RNA. GAM1070 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14854] GAM1070 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1070 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1070 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1070 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1070 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14855] The complementary binding of GAM1070 RNA, herein designated GAM RNA, to target binding sites on GAM1070 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1070 target RNA, herein designated GAM TARGET RNA, into GAM1070 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14856] It is appreciated that GAM1070 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1070 target genes. The mRNA of each one of this plurality of GAM1070 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1070 RNA, herein designated GAM RNA, and which when bound by GAM1070 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1070 target proteins.

[14857] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1070 gene, herein designated GAM GENE, on one or more GAM1070 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14858] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1070 correlate with, and may be deduced from, the identity of the target genes which GAM1070 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14859] Nucleotide sequences of the GAM1070 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1070 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1070 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1070 are further described hereinbelow with reference to Table 1.

[14860] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1070 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14861] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1071 (GAM1071) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14862] GAM1071 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1071 was detected is described hereinabove with reference to Figs. 2-8.

[14863] GAM1071 gene, herein designated GAM GENE, and GAM1071 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14864] GAM1071 gene, herein designated GAM GENE, encodes a GAM1071 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1071 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1071 precursor RNA is designated SEQ ID:1048, and is provided hereinbelow with reference to the sequence listing part.

[14865] GAM1071 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14866] An enzyme complex designated DICER COMPLEX, dices the GAM1071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1071 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1071 RNA is designated SEQ ID:3649, and is provided hereinbelow with reference to the sequence listing part.

[14867] GAM1071 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1071 target RNA, herein designated GAM TARGET RNA. GAM1071 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14868] GAM1071 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1071 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1071 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1071 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1071 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14869] The complementary binding of GAM1071 RNA, herein designated GAM RNA, to target binding sites on GAM1071 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1071 target RNA, herein designated GAM TARGET RNA, into GAM1071 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14870] It is appreciated that GAM1071 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1071 target genes. The mRNA of each one of this plurality of GAM1071 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1071 RNA, herein designated GAM RNA, and which when bound by GAM1071 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1071 target proteins.

[14871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1071 gene, herein designated GAM GENE, on one or more GAM1071 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14872] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1071 correlate with, and may be deduced from, the identity of the target genes which GAM1071 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14873] Nucleotide sequences of the GAM1071 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1071 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1071 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1071 are further described hereinbelow with reference to Table 1.

[14874] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1071 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14875] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1072 (GAM1072) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14876] GAM1072 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1072 was detected is described hereinabove with reference to Figs. 2-8.

[14877] GAM1072 gene, herein designated GAM GENE, and GAM1072 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14878] GAM1072 gene, herein designated GAM GENE, encodes a GAM1072 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1072 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1072 precursor RNA is designated SEQ ID:1049, and is provided hereinbelow with reference to the sequence listing part.

[14879] GAM1072 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1072 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14880] An enzyme complex designated DICER COMPLEX, dices the GAM1072 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1072 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1072 RNA is designated SEQ ID:3651, and is provided hereinbelow with reference to the sequence listing part.

[14881] GAM1072 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1072 target RNA, herein designated GAM TARGET RNA. GAM1072 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14882] GAM1072 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1072 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1072 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1072 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1072 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14883] The complementary binding of GAM1072 RNA, herein designated GAM RNA, to target binding sites on GAM1072 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1072 target RNA, herein designated GAM TARGET RNA, into GAM1072 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14884] It is appreciated that GAM1072 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1072 target genes. The mRNA of each one of this plurality of GAM1072 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1072 RNA, herein designated GAM RNA, and which when bound by GAM1072 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1072 target proteins.

[14885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1072 gene, herein designated GAM GENE, on one or more GAM1072 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14886] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1072 correlate with, and may be deduced from, the identity of the target genes which GAM1072 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14887] Nucleotide sequences of the GAM1072 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1072 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1072 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1072 are further described hereinbelow with reference to Table 1.

[14888] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1072 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14889] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1073 (GAM1073) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14890] GAM1073 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1073 was detected is described hereinabove with reference to Figs. 2-8.

[14891] GAM1073 gene, herein designated GAM GENE, and GAM1073 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14892] GAM1073 gene, herein designated GAM GENE, encodes a GAM1073 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1073 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1073 precursor RNA is designated SEQ ID:1050, and is provided hereinbelow with reference to the sequence listing part.

[14893] GAM1073 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1073 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14894] An enzyme complex designated DICER COMPLEX, dices the GAM1073 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1073 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1073 RNA is designated SEQ ID:3652, and is provided hereinbelow with reference to the sequence listing part.

[14895] GAM1073 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1073 target RNA, herein designated GAM TARGET RNA. GAM1073 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14896] GAM1073 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1073 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1073 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1073 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1073 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14897] The complementary binding of GAM1073 RNA, herein designated GAM RNA, to target binding sites on GAM1073 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1073 target RNA, herein designated GAM TARGET RNA, into GAM1073 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14898] It is appreciated that GAM1073 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1073 target genes. The mRNA of each one of this plurality of GAM1073 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1073 RNA, herein designated GAM RNA, and which when bound by GAM1073 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1073 target proteins.

[14899] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1073 gene, herein designated GAM GENE, on one or more GAM1073 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14900] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1073 correlate with, and may be deduced from, the identity of the target genes which GAM1073 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14901] Nucleotide sequences of the GAM1073 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1073 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1073 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1073 are further described hereinbelow with reference to Table 1.

[14902] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1073 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14903] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1074 (GAM1074) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14904] GAM1074 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1074 was detected is described hereinabove with reference to Figs. 2-8.

[14905] GAM1074 gene, herein designated GAM GENE, and GAM1074 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14906] GAM1074 gene, herein designated GAM GENE, encodes a GAM1074 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1074 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1074 precursor RNA is designated SEQ ID:1051, and is provided hereinbelow with reference to the sequence listing part.

[14907] GAM1074 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14908] An enzyme complex designated DICER COMPLEX, dices the GAM1074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1074 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1074 RNA is designated SEQ ID:3653, and is provided hereinbelow with reference to the sequence listing part.

[14909] GAM1074 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1074 target RNA, herein designated GAM TARGET RNA. GAM1074 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14910] GAM1074 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1074 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1074 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1074 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1074 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14911] The complementary binding of GAM1074 RNA, herein designated GAM RNA, to target binding sites on GAM1074 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1074 target RNA, herein designated GAM TARGET RNA, into GAM1074 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14912] It is appreciated that GAM1074 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1074 target genes. The

mRNA of each one of this plurality of GAM1074 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1074 RNA, herein designated GAM RNA, and which when bound by GAM1074 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1074 target proteins.

[14913] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1074 gene, herein designated GAM GENE, on one or more GAM1074 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14914] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1074 correlate with, and may be deduced from, the identity of the target genes which GAM1074 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14915] Nucleotide sequences of the GAM1074 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1074 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1074 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1074 are further described hereinbelow with reference to Table 1.

[14916] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1074 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14917] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1075 (GAM1075) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14918] GAM1075 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1075 was detected is described hereinabove with reference to Figs. 2-8.

[14919] GAM1075 gene, herein designated GAM GENE, and GAM1075 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14920] GAM1075 gene, herein designated GAM GENE, encodes a GAM1075 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1075 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1075 precursor RNA is designated SEQ ID:1052, and is provided hereinbelow with reference to the sequence listing part.

[14921] GAM1075 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14922] An enzyme complex designated DICER COMPLEX, dices the GAM1075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1075 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1075 RNA is designated SEQ ID:3654, and is provided hereinbelow with reference to the sequence listing part.

[14923] GAM1075 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1075 target RNA, herein designated GAM TARGET RNA. GAM1075 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14924] GAM1075 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1075 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1075 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1075 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1075 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14925] The complementary binding of GAM1075 RNA, herein designated GAM RNA, to target binding sites on GAM1075 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1075 target RNA, herein designated GAM TARGET RNA, into GAM1075 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14926] It is appreciated that GAM1075 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1075 target genes. The mRNA of each one of this plurality of GAM1075 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1075 RNA, herein designated GAM RNA, and which when bound by GAM1075 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1075 target proteins.

[14927] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1075 gene, herein designated GAM GENE, on one or more GAM1075 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14928] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1075 correlate with, and may be deduced from, the identity of the target

genes which GAM1075 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14929] Nucleotide sequences of the GAM1075 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1075 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1075 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1075 are further described hereinbelow with reference to Table 1.

[14930] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1075 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14931] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1076 (GAM1076) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14932] GAM1076 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1076 was detected is described hereinabove with reference to Figs. 2-8.

[14933] GAM1076 gene, herein designated GAM GENE, and GAM1076 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[14934] GAM1076 gene, herein designated GAM GENE, encodes a GAM1076 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1076 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1076 precursor RNA is designated SEQ ID:1053, and is provided hereinbelow with reference to the sequence listing part.

[14935] GAM1076 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14936] An enzyme complex designated DICER COMPLEX, dices the GAM1076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1076 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1076 RNA is designated SEQ ID:3655, and is provided

hereinbelow with reference to the sequence listing part.

[14937] GAM1076 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1076 target RNA, herein designated GAM TARGET RNA. GAM1076 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14938] GAM1076 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1076 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1076 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1076 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1076 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14939] The complementary binding of GAM1076 RNA, herein designated GAM RNA, to target binding sites on GAM1076 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1076 target RNA, herein designated GAM TARGET RNA, into GAM1076 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14940] It is appreciated that GAM1076 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1076 target genes. The mRNA of each one of this plurality of GAM1076 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1076 RNA, herein designated GAM RNA, and which when bound by GAM1076 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1076 target proteins.

[14941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1076 gene, herein designated GAM GENE, on one or more GAM1076 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14942] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1076 correlate with, and may be deduced from, the identity of the target genes which GAM1076 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14943] Nucleotide sequences of the GAM1076 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1076 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1076 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1076 are further described hereinbelow with reference to Table 1.

[14944] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1076 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14945] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1077 (GAM1077) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14946] GAM1077 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1077 was detected is described hereinabove with reference to Figs. 2-8.

[14947] GAM1077 gene, herein designated GAM GENE, and GAM1077 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14948] GAM1077 gene, herein designated GAM GENE, encodes a GAM1077 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1077 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1077 precursor RNA is designated SEQ ID:1054, and is provided hereinbelow with reference to the sequence listing part.

[14949] GAM1077 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14950] An enzyme complex designated DICER COMPLEX, dices the GAM1077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1077 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1077 RNA is designated SEQ ID:3656, and is provided hereinbelow with reference to the sequence listing part.

[14951] GAM1077 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1077 target RNA, herein designated GAM TARGET RNA. GAM1077 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14952] GAM1077 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1077 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1077 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1077 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1077 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14953] The complementary binding of GAM1077 RNA, herein designated GAM RNA, to target binding sites on GAM1077 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1077 target RNA, herein designated GAM TARGET RNA, into GAM1077 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14954] It is appreciated that GAM1077 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1077 target genes. The mRNA of each one of this plurality of GAM1077 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1077 RNA, herein designated GAM RNA, and which when bound by GAM1077 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1077 target proteins.

[14955] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1077 gene, herein designated GAM GENE, on one or more GAM1077 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14956] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1077 correlate with, and may be deduced from, the identity of the target genes which GAM1077 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14957] Nucleotide sequences of the GAM1077 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1077 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1077 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1077 are further described hereinbelow with reference to Table 1.

[14958] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1077 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14959] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1078 (GAM1078) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14960] GAM1078 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1078 was detected is described hereinabove with reference to Figs. 2-8.

[14961] GAM1078 gene, herein designated GAM GENE, and GAM1078 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14962] GAM1078 gene, herein designated GAM GENE, encodes a GAM1078 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1078 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1078 precursor RNA is designated SEQ ID:1055, and is provided hereinbelow with reference to the sequence listing part.

[14963] GAM1078 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14964] An enzyme complex designated DICER COMPLEX, dices the GAM1078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1078 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1078 RNA is designated SEQ ID:3657, and is provided hereinbelow with reference to the sequence listing part.

[14965] GAM1078 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1078 target RNA, herein designated GAM TARGET RNA. GAM1078 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14966] GAM1078 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1078 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1078 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1078 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1078 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14967] The complementary binding of GAM1078 RNA, herein designated GAM RNA, to target binding sites on GAM1078 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1078 target RNA, herein designated GAM TARGET RNA, into GAM1078 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14968] It is appreciated that GAM1078 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1078 target genes. The mRNA of each one of this plurality of GAM1078 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1078 RNA, herein designated GAM RNA, and which when bound by GAM1078 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1078 target proteins.

[14969] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1078 gene, herein designated GAM GENE, on one or more GAM1078 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14970] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1078 correlate with, and may be deduced from, the identity of the target genes which GAM1078 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14971] Nucleotide sequences of the GAM1078 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1078 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1078 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1078 are further described hereinbelow with reference to Table 1.

[14972] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1078 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[14973] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1079 (GAM1079) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14974] GAM1079 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1079 was detected is described hereinabove with reference to Figs. 2-8.

[14975] GAM1079 gene, herein designated GAM GENE, and GAM1079 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14976] GAM1079 gene, herein designated GAM GENE, encodes a GAM1079 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1079 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1079 precursor RNA is designated SEQ ID:1056, and is provided hereinbelow with reference to the sequence listing part.

[14977] GAM1079 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14978] An enzyme complex designated DICER COMPLEX, dices the GAM1079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1079 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM1079 RNA is designated SEQ ID:3658, and is provided hereinbelow with reference to the sequence listing part.

[14979] GAM1079 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1079 target RNA, herein designated GAM TARGET RNA. GAM1079 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14980] GAM1079 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1079 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1079 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1079 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1079 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14981] The complementary binding of GAM1079 RNA, herein designated GAM RNA, to target binding sites on GAM1079 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1079 target RNA, herein designated GAM TARGET RNA, into GAM1079 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14982] It is appreciated that GAM1079 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1079 target genes. The mRNA of each one of this plurality of GAM1079 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1079 RNA, herein designated GAM RNA, and which when bound by GAM1079 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1079 target proteins.

[14983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1079 gene, herein designated GAM GENE, on one or more GAM1079 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14984] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1079 correlate with, and may be deduced from, the identity of the target genes which GAM1079 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14985] Nucleotide sequences of the GAM1079 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1079 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1079 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1079 are further described hereinbelow with reference to Table 1.

[14986] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1079 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[14987] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1080 (GAM1080) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[14988] GAM1080 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1080 was detected is described hereinabove with reference to Figs. 2-8.

[14989] GAM1080 gene, herein designated GAM GENE, and GAM1080 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[14990] GAM1080 gene, herein designated GAM GENE, encodes a GAM1080 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1080 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1080 precursor RNA is designated SEQ ID:1057, and is provided hereinbelow with reference to the sequence listing part.

[14991] GAM1080 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14992] An enzyme complex designated DICER COMPLEX, dices the GAM1080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1080 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1080 RNA is designated SEQ ID:3659, and is provided hereinbelow with reference to the sequence listing part.

[14993] GAM1080 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1080 target RNA, herein designated GAM TARGET RNA. GAM1080 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14994] GAM1080 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1080 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1080 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1080 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1080 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14995] The complementary binding of GAM1080 RNA, herein designated GAM RNA, to target binding sites on GAM1080 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1080 target RNA, herein designated GAM TARGET RNA, into GAM1080 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[14996] It is appreciated that GAM1080 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1080 target genes. The

mRNA of each one of this plurality of GAM1080 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1080 RNA, herein designated GAM RNA, and which when bound by GAM1080 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1080 target proteins.

[14997] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1080 gene, herein designated GAM GENE, on one or more GAM1080 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14998] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1080 correlate with, and may be deduced from, the identity of the target genes which GAM1080 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14999] Nucleotide sequences of the GAM1080 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1080 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1080 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1080 are further described hereinbelow with reference to Table 1.

[15000] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1080 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15001] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1081 (GAM1081) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15002] GAM1081 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1081 was detected is described hereinabove with reference to Figs. 2-8.

[15003] GAM1081 gene, herein designated GAM GENE, and GAM1081 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15004] GAM1081 gene, herein designated GAM GENE, encodes a GAM1081 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1081 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1081 precursor RNA is designated SEQ ID:1058, and is provided hereinbelow with reference to the sequence listing part.

[15005] GAM1081 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15006] An enzyme complex designated DICER COMPLEX, dices the GAM1081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1081 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1081 RNA is designated SEQ ID:3660, and is provided hereinbelow with reference to the sequence listing part.

[15007] GAM1081 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1081 target RNA, herein designated GAM TARGET RNA. GAM1081 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15008] GAM1081 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1081 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1081 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1081 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1081 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15009] The complementary binding of GAM1081 RNA, herein designated GAM RNA, to target binding sites on GAM1081 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1081 target RNA, herein designated GAM TARGET RNA, into GAM1081 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15010] It is appreciated that GAM1081 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1081 target genes. The mRNA of each one of this plurality of GAM1081 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1081 RNA, herein designated GAM RNA, and which when bound by GAM1081 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1081 target proteins.

[15011] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1081 gene, herein designated GAM GENE, on one or more GAM1081 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15012] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1081 correlate with, and may be deduced from, the identity of the target

genes which GAM1081 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15013] Nucleotide sequences of the GAM1081 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1081 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1081 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1081 are further described hereinbelow with reference to Table 1.

[15014] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1081 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15015] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1082 (GAM1082) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15016] GAM1082 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1082 was detected is described hereinabove with reference to Figs. 2-8.

[15017] GAM1082 gene, herein designated GAM GENE, and GAM1082 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15018] GAM1082 gene, herein designated GAM GENE, encodes a GAM1082 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1082 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1082 precursor RNA is designated SEQ ID:1059, and is provided hereinbelow with reference to the sequence listing part.

[15019] GAM1082 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15020] An enzyme complex designated DICER COMPLEX, dices the GAM1082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1082 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1082 RNA is designated SEQ ID:3661, and is provided

hereinbelow with reference to the sequence listing part.

[15021] GAM1082 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1082 target RNA, herein designated GAM TARGET RNA. GAM1082 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15022] GAM1082 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1082 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1082 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1082 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1082 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15023] The complementary binding of GAM1082 RNA, herein designated GAM RNA, to target binding sites on GAM1082 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1082 target RNA, herein designated GAM TARGET RNA, into GAM1082 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15024] It is appreciated that GAM1082 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1082 target genes. The mRNA of each one of this plurality of GAM1082 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1082 RNA, herein designated GAM RNA, and which when bound by GAM1082 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1082 target proteins.

[15025] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1082 gene, herein designated GAM GENE, on one or more GAM1082 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15026] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1082 correlate with, and may be deduced from, the identity of the target genes which GAM1082 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15027] Nucleotide sequences of the GAM1082 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1082 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1082 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1082 are further described hereinbelow with reference to Table 1.

[15028] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1082 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15029] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1083 (GAM1083) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15030] GAM1083 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1083 was detected is described hereinabove with reference to Figs. 2-8.

[15031] GAM1083 gene, herein designated GAM GENE, and GAM1083 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15032] GAM1083 gene, herein designated GAM GENE, encodes a GAM1083 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1083 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1083 precursor RNA is designated SEQ ID:1060, and is provided hereinbelow with reference to the sequence listing part.

[15033] GAM1083 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15034] An enzyme complex designated DICER COMPLEX, dices the GAM1083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1083 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1083 RNA is designated SEQ ID:3662, and is provided hereinbelow with reference to the sequence listing part.

[15035] GAM1083 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1083 target RNA, herein designated GAM TARGET RNA. GAM1083 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15036] GAM1083 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1083 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1083 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1083 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1083 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15037] The complementary binding of GAM1083 RNA, herein designated GAM RNA, to target binding sites on GAM1083 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1083 target RNA, herein designated GAM TARGET RNA, into GAM1083 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15038] It is appreciated that GAM1083 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1083 target genes. The mRNA of each one of this plurality of GAM1083 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1083 RNA, herein designated GAM RNA, and which when bound by GAM1083 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1083 target proteins.

[15039] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1083 gene, herein designated GAM GENE, on one or more GAM1083 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15040] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1083 correlate with, and may be deduced from, the identity of the target genes which GAM1083 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15041] Nucleotide sequences of the GAM1083 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1083 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1083 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1083 are further described hereinbelow with reference to Table 1.

[15042] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1083 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15043] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1084 (GAM1084) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15044] GAM1084 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1084 was detected is described hereinabove with reference to Figs. 2-8.

[15045] GAM1084 gene, herein designated GAM GENE, and GAM1084 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15046] GAM1084 gene, herein designated GAM GENE, encodes a GAM1084 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1084 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1084 precursor RNA is designated SEQ ID:1061, and is provided hereinbelow with reference to the sequence listing part.

[15047] GAM1084 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15048] An enzyme complex designated DICER COMPLEX, dices the GAM1084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1084 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1084 RNA is designated SEQ ID:3663, and is provided hereinbelow with reference to the sequence listing part.

[15049] GAM1084 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1084 target RNA, herein designated GAM TARGET RNA. GAM1084 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15050] GAM1084 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1084 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1084 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1084 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1084 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15051] The complementary binding of GAM1084 RNA, herein designated GAM RNA, to target binding sites on GAM1084 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1084 target RNA, herein designated GAM TARGET RNA, into GAM1084 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15052] It is appreciated that GAM1084 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1084 target genes. The mRNA of each one of this plurality of GAM1084 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1084 RNA, herein designated GAM RNA, and which when bound by GAM1084 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1084 target proteins.

[15053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1084 gene, herein designated GAM GENE, on one or more GAM1084 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15054] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1084 correlate with, and may be deduced from, the identity of the target genes which GAM1084 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15055] Nucleotide sequences of the GAM1084 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1084 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1084 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1084 are further described hereinbelow with reference to Table 1.

[15056] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1084 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15057] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1085 (GAM1085) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15058] GAM1085 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1085 was detected is described hereinabove with reference to Figs. 2-8.

[15059] GAM1085 gene, herein designated GAM GENE, and GAM1085 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15060] GAM1085 gene, herein designated GAM GENE, encodes a GAM1085 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1085 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1085 precursor RNA is designated SEQ ID:1062, and is provided hereinbelow with reference to the sequence listing part.

[15061] GAM1085 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15062] An enzyme complex designated DICER COMPLEX, dices the GAM1085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1085 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1085 RNA is designated SEQ ID:3664, and is provided hereinbelow with reference to the sequence listing part.

[15063] GAM1085 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1085 target RNA, herein designated GAM TARGET RNA. GAM1085 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15064] GAM1085 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1085 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1085 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1085 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1085 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15065] The complementary binding of GAM1085 RNA, herein designated GAM RNA, to target binding sites on GAM1085 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1085 target RNA, herein designated GAM TARGET RNA, into GAM1085 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15066] It is appreciated that GAM1085 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1085 target genes. The mRNA of each one of this plurality of GAM1085 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1085 RNA, herein designated GAM RNA, and which when bound by GAM1085 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1085 target proteins.

[15067] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1085 gene, herein designated GAM GENE, on one or more GAM1085 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15068] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1085 correlate with, and may be deduced from, the identity of the target genes which GAM1085 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15069] Nucleotide sequences of the GAM1085 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1085 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1085 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1085 are further described hereinbelow with reference to Table 1.

[15070] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1085 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15071] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1086 (GAM1086) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15072] GAM1086 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1086 was detected is described hereinabove with reference to Figs. 2-8.

[15073] GAM1086 gene, herein designated GAM GENE, and GAM1086 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15074] GAM1086 gene, herein designated GAM GENE, encodes a GAM1086 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1086 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1086 precursor RNA is designated SEQ ID:1063, and is provided hereinbelow with reference to the sequence listing part.

[15075] GAM1086 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1086 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15076] An enzyme complex designated DICER COMPLEX, dices the GAM1086 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1086 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1086 RNA is designated SEQ ID:3665, and is provided hereinbelow with reference to the sequence listing part.

[15077] GAM1086 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1086 target RNA, herein designated GAM TARGET RNA. GAM1086 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15078] GAM1086 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1086 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1086 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1086 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1086 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15079] The complementary binding of GAM1086 RNA, herein designated GAM RNA, to target binding sites on GAM1086 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1086 target RNA, herein designated GAM TARGET RNA, into GAM1086 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15080] It is appreciated that GAM1086 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1086 target genes. The

mRNA of each one of this plurality of GAM1086 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1086 RNA, herein designated GAM RNA, and which when bound by GAM1086 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1086 target proteins.

[15081] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1086 gene, herein designated GAM GENE, on one or more GAM1086 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15082] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1086 correlate with, and may be deduced from, the identity of the target genes which GAM1086 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15083] Nucleotide sequences of the GAM1086 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1086 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1086 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1086 are further described hereinbelow with reference to Table 1.

[15084] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1086 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15085] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1087 (GAM1087) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15086] GAM1087 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1087 was detected is described hereinabove with reference to Figs. 2-8.

[15087] GAM1087 gene, herein designated GAM GENE, and GAM1087 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15088] GAM1087 gene, herein designated GAM GENE, encodes a GAM1087 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1087 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1087 precursor RNA is designated SEQ ID:1064, and is provided hereinbelow with reference to the sequence listing part.

[15089] GAM1087 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15090] An enzyme complex designated DICER COMPLEX, dices the GAM1087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1087 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1087 RNA is designated SEQ ID:3666, and is provided hereinbelow with reference to the sequence listing part.

[15091] GAM1087 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1087 target RNA, herein designated GAM TARGET RNA. GAM1087 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15092] GAM1087 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1087 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1087 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1087 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1087 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15093] The complementary binding of GAM1087 RNA, herein designated GAM RNA, to target binding sites on GAM1087 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1087 target RNA, herein designated GAM TARGET RNA, into GAM1087 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15094] It is appreciated that GAM1087 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1087 target genes. The mRNA of each one of this plurality of GAM1087 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1087 RNA, herein designated GAM RNA, and which when bound by GAM1087 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1087 target proteins.

[15095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1087 gene, herein designated GAM GENE, on one or more GAM1087 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15096] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1087 correlate with, and may be deduced from, the identity of the target

genes which GAM1087 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15097] Nucleotide sequences of the GAM1087 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1087 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1087 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1087 are further described hereinbelow with reference to Table 1.

[15098] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1087 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15099] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1088 (GAM1088) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15100] GAM1088 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1088 was detected is described hereinabove with reference to Figs. 2-8.

[15101] GAM1088 gene, herein designated GAM GENE, and GAM1088 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15102] GAM1088 gene, herein designated GAM GENE, encodes a GAM1088 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1088 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1088 precursor RNA is designated SEQ ID:1065, and is provided hereinbelow with reference to the sequence listing part.

[15103] GAM1088 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15104] An enzyme complex designated DICER COMPLEX, dices the GAM1088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1088 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1088 RNA is designated SEQ ID:3667, and is provided

hereinbelow with reference to the sequence listing part.

[15105] GAM1088 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1088 target RNA, herein designated GAM TARGET RNA. GAM1088 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15106] GAM1088 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1088 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1088 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1088 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1088 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15107] The complementary binding of GAM1088 RNA, herein designated GAM RNA, to target binding sites on GAM1088 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1088 target RNA, herein designated GAM TARGET RNA, into GAM1088 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15108] It is appreciated that GAM1088 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1088 target genes. The mRNA of each one of this plurality of GAM1088 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1088 RNA, herein designated GAM RNA, and which when bound by GAM1088 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1088 target proteins.

[15109] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1088 gene, herein designated GAM GENE, on one or more GAM1088 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15110] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1088 correlate with, and may be deduced from, the identity of the target genes which GAM1088 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15111] Nucleotide sequences of the GAM1088 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1088 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1088 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1088 are further described hereinbelow with reference to Table 1.

[15112] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1088 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15113] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1089 (GAM1089) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15114] GAM1089 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1089 was detected is described hereinabove with reference to Figs. 2-8.

[15115] GAM1089 gene, herein designated GAM GENE, and GAM1089 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15116] GAM1089 gene, herein designated GAM GENE, encodes a GAM1089 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1089 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1089 precursor RNA is designated SEQ ID:1066, and is provided hereinbelow with reference to the sequence listing part.

[15117] GAM1089 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15118] An enzyme complex designated DICER COMPLEX, dices the GAM1089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1089 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1089 RNA is designated SEQ ID:3668, and is provided hereinbelow with reference to the sequence listing part.

[15119] GAM1089 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1089 target RNA, herein designated GAM TARGET RNA. GAM1089 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15120] GAM1089 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1089 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1089 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1089 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1089 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15121] The complementary binding of GAM1089 RNA, herein designated GAM RNA, to target binding sites on GAM1089 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1089 target RNA, herein designated GAM TARGET RNA, into GAM1089 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15122] It is appreciated that GAM1089 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1089 target genes. The mRNA of each one of this plurality of GAM1089 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1089 RNA, herein designated GAM RNA, and which when bound by GAM1089 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1089 target proteins.

[15123] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1089 gene, herein designated GAM GENE, on one or more GAM1089 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15124] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1089 correlate with, and may be deduced from, the identity of the target genes which GAM1089 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15125] Nucleotide sequences of the GAM1089 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1089 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1089 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1089 are further described hereinbelow with reference to Table 1.

[15126] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1089 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15127] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1090 (GAM1090) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15128] GAM1090 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1090 was detected is described hereinabove with reference to Figs. 2-8.

[15129] GAM1090 gene, herein designated GAM GENE, and GAM1090 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15130] GAM1090 gene, herein designated GAM GENE, encodes a GAM1090 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1090 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1090 precursor RNA is designated SEQ ID:1067, and is provided hereinbelow with reference to the sequence listing part.

[15131] GAM1090 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15132] An enzyme complex designated DICER COMPLEX, dices the GAM1090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1090 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1090 RNA is designated SEQ ID:3669, and is provided hereinbelow with reference to the sequence listing part.

[15133] GAM1090 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1090 target RNA, herein designated GAM TARGET RNA. GAM1090 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15134] GAM1090 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1090 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1090 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1090 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1090 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15135] The complementary binding of GAM1090 RNA, herein designated GAM RNA, to target binding sites on GAM1090 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1090 target RNA, herein designated GAM TARGET RNA, into GAM1090 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15136] It is appreciated that GAM1090 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1090 target genes. The mRNA of each one of this plurality of GAM1090 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1090 RNA, herein designated GAM RNA, and which when bound by GAM1090 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1090 target proteins.

[15137] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1090 gene, herein designated GAM GENE, on one or more GAM1090 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15138] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1090 correlate with, and may be deduced from, the identity of the target genes which GAM1090 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15139] Nucleotide sequences of the GAM1090 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1090 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1090 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1090 are further described hereinbelow with reference to Table 1.

[15140] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1090 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15141] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1091 (GAM1091) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15142] GAM1091 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1091 was detected is described hereinabove with reference to Figs. 2-8.

[15143] GAM1091 gene, herein designated GAM GENE, and GAM1091 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15144] GAM1091 gene, herein designated GAM GENE, encodes a GAM1091 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1091 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1091 precursor RNA is designated SEQ ID:1068, and is provided hereinbelow with reference to the sequence listing part.

[15145] GAM1091 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15146] An enzyme complex designated DICER COMPLEX, dices the GAM1091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1091 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1091 RNA is designated SEQ ID:3670, and is provided hereinbelow with reference to the sequence listing part.

[15147] GAM1091 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1091 target RNA, herein designated GAM TARGET RNA. GAM1091 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15148] GAM1091 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1091 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1091 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1091 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1091 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15149] The complementary binding of GAM1091 RNA, herein designated GAM RNA, to target binding sites on GAM1091 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1091 target RNA, herein designated GAM TARGET RNA, into GAM1091 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15150] It is appreciated that GAM1091 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1091 target genes. The mRNA of each one of this plurality of GAM1091 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1091 RNA, herein designated GAM RNA, and which when bound by GAM1091 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1091 target proteins.

[15151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1091 gene, herein designated GAM GENE, on one or more GAM1091 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15152] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1091 correlate with, and may be deduced from, the identity of the target genes which GAM1091 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15153] Nucleotide sequences of the GAM1091 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1091 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1091 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1091 are further described hereinbelow with reference to Table 1.

[15154] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1091 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15155] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1092 (GAM1092) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15156] GAM1092 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1092 was detected is described hereinabove with reference to Figs. 2-8.

[15157] GAM1092 gene, herein designated GAM GENE, and GAM1092 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15158] GAM1092 gene, herein designated GAM GENE, encodes a GAM1092 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1092 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1092 precursor RNA is designated SEQ ID:1069, and is provided hereinbelow with reference to the sequence listing part.

[15159] GAM1092 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15160] An enzyme complex designated DICER COMPLEX, dices the GAM1092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1092 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1092 RNA is designated SEQ ID:3671, and is provided hereinbelow with reference to the sequence listing part.

[15161] GAM1092 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1092 target RNA, herein designated GAM TARGET RNA. GAM1092 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15162] GAM1092 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1092 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1092 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1092 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1092 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15163] The complementary binding of GAM1092 RNA, herein designated GAM RNA, to target binding sites on GAM1092 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1092 target RNA, herein designated GAM TARGET RNA, into GAM1092 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15164] It is appreciated that GAM1092 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1092 target genes. The

mRNA of each one of this plurality of GAM1092 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1092 RNA, herein designated GAM RNA, and which when bound by GAM1092 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1092 target proteins.

[15165] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1092 gene, herein designated GAM GENE, on one or more GAM1092 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15166] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1092 correlate with, and may be deduced from, the identity of the target genes which GAM1092 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15167] Nucleotide sequences of the GAM1092 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1092 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1092 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1092 are further described hereinbelow with reference to Table 1.

[15168] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1092 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15169] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1093 (GAM1093) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15170] GAM1093 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1093 was detected is described hereinabove with reference to Figs. 2-8.

[15171] GAM1093 gene, herein designated GAM GENE, and GAM1093 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15172] GAM1093 gene, herein designated GAM GENE, encodes a GAM1093 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1093 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1093 precursor RNA is designated SEQ ID:1070, and is provided hereinbelow with reference to the sequence listing part.

[15173] GAM1093 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15174] An enzyme complex designated DICER COMPLEX, dices the GAM1093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1093 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1093 RNA is designated SEQ ID:3673, and is provided hereinbelow with reference to the sequence listing part.

[15175] GAM1093 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1093 target RNA, herein designated GAM TARGET RNA. GAM1093 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15176] GAM1093 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1093 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1093 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1093 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1093 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15177] The complementary binding of GAM1093 RNA, herein designated GAM RNA, to target binding sites on GAM1093 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1093 target RNA, herein designated GAM TARGET RNA, into GAM1093 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15178] It is appreciated that GAM1093 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1093 target genes. The mRNA of each one of this plurality of GAM1093 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1093 RNA, herein designated GAM RNA, and which when bound by GAM1093 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1093 target proteins.

[15179] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1093 gene, herein designated GAM GENE, on one or more GAM1093 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15180] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1093 correlate with, and may be deduced from, the identity of the target

genes which GAM1093 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15181] Nucleotide sequences of the GAM1093 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1093 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1093 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1093 are further described hereinbelow with reference to Table 1.

[15182] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1093 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15183] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1094 (GAM1094) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15184] GAM1094 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1094 was detected is described hereinabove with reference to Figs. 2-8.

[15185] GAM1094 gene, herein designated GAM GENE, and GAM1094 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15186] GAM1094 gene, herein designated GAM GENE, encodes a GAM1094 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1094 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1094 precursor RNA is designated SEQ ID:1071, and is provided hereinbelow with reference to the sequence listing part.

[15187] GAM1094 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1094 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15188] An enzyme complex designated DICER COMPLEX, dices the GAM1094 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1094 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1094 RNA is designated SEQ ID:3672, and is provided

hereinbelow with reference to the sequence listing part.

[15189] GAM1094 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1094 target RNA, herein designated GAM TARGET RNA. GAM1094 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15190] GAM1094 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1094 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1094 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1094 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1094 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15191] The complementary binding of GAM1094 RNA, herein designated GAM RNA, to target binding sites on GAM1094 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1094 target RNA, herein designated GAM TARGET RNA, into GAM1094 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15192] It is appreciated that GAM1094 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1094 target genes. The mRNA of each one of this plurality of GAM1094 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1094 RNA, herein designated GAM RNA, and which when bound by GAM1094 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1094 target proteins.

[15193] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1094 gene, herein designated GAM GENE, on one or more GAM1094 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15194] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1094 correlate with, and may be deduced from, the identity of the target genes which GAM1094 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15195] Nucleotide sequences of the GAM1094 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1094 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1094 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1094 are further described hereinbelow with reference to Table 1.

[15196] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1094 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15197] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1095 (GAM1095) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15198] GAM1095 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1095 was detected is described hereinabove with reference to Figs. 2-8.

[15199] GAM1095 gene, herein designated GAM GENE, and GAM1095 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15200] GAM1095 gene, herein designated GAM GENE, encodes a GAM1095 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1095 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1095 precursor RNA is designated SEQ ID:1072, and is provided hereinbelow with reference to the sequence listing part.

[15201] GAM1095 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15202] An enzyme complex designated DICER COMPLEX, dices the GAM1095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1095 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1095 RNA is designated SEQ ID:3675, and is provided hereinbelow with reference to the sequence listing part.

[15203] GAM1095 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1095 target RNA, herein designated GAM TARGET RNA. GAM1095 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15204] GAM1095 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1095 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1095 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1095 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1095 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15205] The complementary binding of GAM1095 RNA, herein designated GAM RNA, to target binding sites on GAM1095 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1095 target RNA, herein designated GAM TARGET RNA, into GAM1095 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15206] It is appreciated that GAM1095 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1095 target genes. The mRNA of each one of this plurality of GAM1095 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1095 RNA, herein designated GAM RNA, and which when bound by GAM1095 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1095 target proteins.

[15207] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1095 gene, herein designated GAM GENE, on one or more GAM1095 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15208] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1095 correlate with, and may be deduced from, the identity of the target genes which GAM1095 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15209] Nucleotide sequences of the GAM1095 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1095 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1095 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1095 are further described hereinbelow with reference to Table 1.

[15210] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1095 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15211] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1096 (GAM1096) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15212] GAM1096 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1096 was detected is described hereinabove with reference to Figs. 2-8.

[15213] GAM1096 gene, herein designated GAM GENE, and GAM1096 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15214] GAM1096 gene, herein designated GAM GENE, encodes a GAM1096 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1096 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1096 precursor RNA is designated SEQ ID:1073, and is provided hereinbelow with reference to the sequence listing part.

[15215] GAM1096 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15216] An enzyme complex designated DICER COMPLEX, dices the GAM1096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1096 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1096 RNA is designated SEQ ID:3674, and is provided hereinbelow with reference to the sequence listing part.

[15217] GAM1096 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1096 target RNA, herein designated GAM TARGET RNA. GAM1096 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15218] GAM1096 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1096 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1096 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1096 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1096 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15219] The complementary binding of GAM1096 RNA, herein designated GAM RNA, to target binding sites on GAM1096 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1096 target RNA, herein designated GAM TARGET RNA, into GAM1096 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15220] It is appreciated that GAM1096 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1096 target genes. The mRNA of each one of this plurality of GAM1096 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1096 RNA, herein designated GAM RNA, and which when bound by GAM1096 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1096 target proteins.

[15221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1096 gene, herein designated GAM GENE, on one or more GAM1096 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15222] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1096 correlate with, and may be deduced from, the identity of the target genes which GAM1096 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15223] Nucleotide sequences of the GAM1096 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1096 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1096 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1096 are further described hereinbelow with reference to Table 1.

[15224] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1096 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15225] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1097 (GAM1097) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15226] GAM1097 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1097 was detected is described hereinabove with reference to Figs. 2-8.

[15227] GAM1097 gene, herein designated GAM GENE, and GAM1097 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15228] GAM1097 gene, herein designated GAM GENE, encodes a GAM1097 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1097 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1097 precursor RNA is designated SEQ ID:1074, and is provided hereinbelow with reference to the sequence listing part.

[15229] GAM1097 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15230] An enzyme complex designated DICER COMPLEX, dices the GAM1097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1097 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1097 RNA is designated SEQ ID:3676, and is provided hereinbelow with reference to the sequence listing part.

[15231] GAM1097 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1097 target RNA, herein designated GAM TARGET RNA. GAM1097 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15232] GAM1097 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1097 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1097 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1097 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1097 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15233] The complementary binding of GAM1097 RNA, herein designated GAM RNA, to target binding sites on GAM1097 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1097 target RNA, herein designated GAM TARGET RNA, into GAM1097 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15234] It is appreciated that GAM1097 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1097 target genes. The mRNA of each one of this plurality of GAM1097 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1097 RNA, herein designated GAM RNA, and which when bound by GAM1097 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1097 target proteins.

[15235] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1097 gene, herein designated GAM GENE, on one or more GAM1097 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15236] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1097 correlate with, and may be deduced from, the identity of the target genes which GAM1097 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15237] Nucleotide sequences of the GAM1097 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1097 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1097 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1097 are further described hereinbelow with reference to Table 1.

[15238] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1097 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15239] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1098 (GAM1098) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15240] GAM1098 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1098 was detected is described hereinabove with reference to Figs. 2-8.

[15241] GAM1098 gene, herein designated GAM GENE, and GAM1098 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15242] GAM1098 gene, herein designated GAM GENE, encodes a GAM1098 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1098 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1098 precursor RNA is designated SEQ ID:1075, and is provided hereinbelow with reference to the sequence listing part.

[15243] GAM1098 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15244] An enzyme complex designated DICER COMPLEX, dices the GAM1098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1098 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1098 RNA is designated SEQ ID:3677, and is provided hereinbelow with reference to the sequence listing part.

[15245] GAM1098 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1098 target RNA, herein designated GAM TARGET RNA. GAM1098 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15246] GAM1098 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1098 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1098 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1098 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1098 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15247] The complementary binding of GAM1098 RNA, herein designated GAM RNA, to target binding sites on GAM1098 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1098 target RNA, herein designated GAM TARGET RNA, into GAM1098 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15248] It is appreciated that GAM1098 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1098 target genes. The

mRNA of each one of this plurality of GAM1098 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1098 RNA, herein designated GAM RNA, and which when bound by GAM1098 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1098 target proteins.

[15249] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1098 gene, herein designated GAM GENE, on one or more GAM1098 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15250] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1098 correlate with, and may be deduced from, the identity of the target genes which GAM1098 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15251] Nucleotide sequences of the GAM1098 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1098 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1098 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1098 are further described hereinbelow with reference to Table 1.

[15252] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1098 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15253] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1099 (GAM1099) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15254] GAM1099 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1099 was detected is described hereinabove with reference to Figs. 2-8.

[15255] GAM1099 gene, herein designated GAM GENE, and GAM1099 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15256] GAM1099 gene, herein designated GAM GENE, encodes a GAM1099 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1099 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1099 precursor RNA is designated SEQ ID:1076, and is provided hereinbelow with reference to the sequence listing part.

[15257] GAM1099 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15258] An enzyme complex designated DICER COMPLEX, dices the GAM1099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1099 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1099 RNA is designated SEQ ID:3679, and is provided hereinbelow with reference to the sequence listing part.

[15259] GAM1099 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1099 target RNA, herein designated GAM TARGET RNA. GAM1099 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15260] GAM1099 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1099 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1099 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1099 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1099 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15261] The complementary binding of GAM1099 RNA, herein designated GAM RNA, to target binding sites on GAM1099 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1099 target RNA, herein designated GAM TARGET RNA, into GAM1099 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15262] It is appreciated that GAM1099 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1099 target genes. The mRNA of each one of this plurality of GAM1099 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1099 RNA, herein designated GAM RNA, and which when bound by GAM1099 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1099 target proteins.

[15263] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1099 gene, herein designated GAM GENE, on one or more GAM1099 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15264] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1099 correlate with, and may be deduced from, the identity of the target

genes which GAM1099 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15265] Nucleotide sequences of the GAM1099 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1099 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1099 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1099 are further described hereinbelow with reference to Table 1.

[15266] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1099 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15267] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1100 (GAM1100) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15268] GAM1100 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1100 was detected is described hereinabove with reference to Figs. 2-8.

[15269] GAM1100 gene, herein designated GAM GENE, and GAM1100 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15270] GAM1100 gene, herein designated GAM GENE, encodes a GAM1100 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1100 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1100 precursor RNA is designated SEQ ID:1077, and is provided hereinbelow with reference to the sequence listing part.

[15271] GAM1100 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15272] An enzyme complex designated DICER COMPLEX, dices the GAM1100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1100 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1100 RNA is designated SEQ ID:3678, and is provided

hereinbelow with reference to the sequence listing part.

[15273] GAM1100 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1100 target RNA, herein designated GAM TARGET RNA. GAM1100 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15274] GAM1100 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1100 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1100 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1100 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1100 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15275] The complementary binding of GAM1100 RNA, herein designated GAM RNA, to target binding sites on GAM1100 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1100 target RNA, herein designated GAM TARGET RNA, into GAM1100 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15276] It is appreciated that GAM1100 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1100 target genes. The mRNA of each one of this plurality of GAM1100 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1100 RNA, herein designated GAM RNA, and which when bound by GAM1100 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1100 target proteins.

[15277] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1100 gene, herein designated GAM GENE, on one or more GAM1100 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15278] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1100 correlate with, and may be deduced from, the identity of the target genes which GAM1100 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15279] Nucleotide sequences of the GAM1100 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1100 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1100 are further described hereinbelow with reference to Table 1.

[15280] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1100 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15281] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1101 (GAM1101) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15282] GAM1101 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1101 was detected is described hereinabove with reference to Figs. 2-8.

[15283] GAM1101 gene, herein designated GAM GENE, and GAM1101 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15284] GAM1101 gene, herein designated GAM GENE, encodes a GAM1101 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1101 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1101 precursor RNA is designated SEQ ID:1078, and is provided hereinbelow with reference to the sequence listing part.

[15285] GAM1101 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15286] An enzyme complex designated DICER COMPLEX, dices the GAM1101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1101 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1101 RNA is designated SEQ ID:3680, and is provided hereinbelow with reference to the sequence listing part.

[15287] GAM1101 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1101 target RNA, herein designated GAM TARGET RNA. GAM1101 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15288] GAM1101 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1101 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1101 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1101 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1101 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15289] The complementary binding of GAM1101 RNA, herein designated GAM RNA, to target binding sites on GAM1101 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1101 target RNA, herein designated GAM TARGET RNA, into GAM1101 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15290] It is appreciated that GAM1101 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1101 target genes. The mRNA of each one of this plurality of GAM1101 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1101 RNA, herein designated GAM RNA, and which when bound by GAM1101 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1101 target proteins.

[15291] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1101 gene, herein designated GAM GENE, on one or more GAM1101 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15292] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1101 correlate with, and may be deduced from, the identity of the target genes which GAM1101 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15293] Nucleotide sequences of the GAM1101 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1101 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1101 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1101 are further described hereinbelow with reference to Table 1.

[15294] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1101 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15295] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1102 (GAM1102) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15296] GAM1102 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1102 was detected is described hereinabove with reference to Figs. 2-8.

[15297] GAM1102 gene, herein designated GAM GENE, and GAM1102 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15298] GAM1102 gene, herein designated GAM GENE, encodes a GAM1102 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1102 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1102 precursor RNA is designated SEQ ID:1079, and is provided hereinbelow with reference to the sequence listing part.

[15299] GAM1102 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15300] An enzyme complex designated DICER COMPLEX, dices the GAM1102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1102 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1102 RNA is designated SEQ ID:3681, and is provided hereinbelow with reference to the sequence listing part.

[15301] GAM1102 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1102 target RNA, herein designated GAM TARGET RNA. GAM1102 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15302] GAM1102 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1102 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1102 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1102 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1102 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15303] The complementary binding of GAM1102 RNA, herein designated GAM RNA, to target binding sites on GAM1102 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1102 target RNA, herein designated GAM TARGET RNA, into GAM1102 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15304] It is appreciated that GAM1102 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1102 target genes. The mRNA of each one of this plurality of GAM1102 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1102 RNA, herein designated GAM RNA, and which when bound by GAM1102 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1102 target proteins.

[15305] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1102 gene, herein designated GAM GENE, on one or more GAM1102 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15306] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1102 correlate with, and may be deduced from, the identity of the target genes which GAM1102 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15307] Nucleotide sequences of the GAM1102 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1102 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1102 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1102 are further described hereinbelow with reference to Table 1.

[15308] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1102 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15309] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1103 (GAM1103) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15310] GAM1103 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1103 was detected is described hereinabove with reference to Figs. 2-8.

[15311] GAM1103 gene, herein designated GAM GENE, and GAM1103 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15312] GAM1103 gene, herein designated GAM GENE, encodes a GAM1103 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1103 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1103 precursor RNA is designated SEQ ID:1080, and is provided hereinbelow with reference to the sequence listing part.

[15313] GAM1103 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1103 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15314] An enzyme complex designated DICER COMPLEX, dices the GAM1103 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1103 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1103 RNA is designated SEQ ID:3682, and is provided hereinbelow with reference to the sequence listing part.

[15315] GAM1103 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1103 target RNA, herein designated GAM TARGET RNA. GAM1103 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15316] GAM1103 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1103 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1103 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1103 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1103 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[15317] The complementary binding of GAM1103 RNA, herein designated GAM RNA, to target binding sites on GAM1103 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1103 target RNA, herein designated GAM TARGET RNA, into GAM1103 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15318] It is appreciated that GAM1103 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1103 target genes. The mRNA of each one of this plurality of GAM1103 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1103 RNA, herein designated GAM RNA, and which when bound by GAM1103 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1103 target proteins.

[15319] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1103 gene, herein designated GAM GENE, on one or more GAM1103 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15320] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1103 correlate with, and may be deduced from, the identity of the target genes which GAM1103 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15321] Nucleotide sequences of the GAM1103 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1103 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1103 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1103 are further described hereinbelow with reference to Table 1.

[15322] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1103 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15323] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1104 (GAM1104) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15324] GAM1104 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1104 was detected is described hereinabove with reference to Figs. 2-8.

[15325] GAM1104 gene, herein designated GAM GENE, and GAM1104 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15326] GAM1104 gene, herein designated GAM GENE, encodes a GAM1104 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1104 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1104 precursor RNA is designated SEQ ID:1081, and is provided hereinbelow with reference to the sequence listing part.

[15327] GAM1104 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1104 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15328] An enzyme complex designated DICER COMPLEX, dices the GAM1104 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1104 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1104 RNA is designated SEQ ID:3683, and is provided hereinbelow with reference to the sequence listing part.

[15329] GAM1104 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1104 target RNA, herein designated GAM TARGET RNA. GAM1104 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15330] GAM1104 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1104 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1104 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1104 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1104 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15331] The complementary binding of GAM1104 RNA, herein designated GAM RNA, to target binding sites on GAM1104 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1104 target RNA, herein designated GAM TARGET RNA, into GAM1104 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15332] It is appreciated that GAM1104 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1104 target genes. The mRNA of each one of this plurality of GAM1104 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1104 RNA, herein designated GAM RNA, and which when bound by GAM1104 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1104 target proteins.

[15333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1104 gene, herein designated GAM GENE, on one or more GAM1104 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15334] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1104 correlate with, and may be deduced from, the identity of the target genes which GAM1104 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15335] Nucleotide sequences of the GAM1104 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1104 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1104 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1104 are further described hereinbelow with reference to Table 1.

[15336] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1104 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15337] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1105 (GAM1105) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15338] GAM1105 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1105 was detected is described hereinabove with reference to Figs. 2-8.

[15339] GAM1105 gene, herein designated GAM GENE, and GAM1105 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15340] GAM1105 gene, herein designated GAM GENE, encodes a GAM1105 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1105 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1105 precursor RNA is designated SEQ ID:1082, and is provided hereinbelow with reference to the sequence listing part.

[15341] GAM1105 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15342] An enzyme complex designated DICER COMPLEX, dices the GAM1105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1105 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1105 RNA is designated SEQ ID:3684, and is provided hereinbelow with reference to the sequence listing part.

[15343] GAM1105 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1105 target RNA, herein designated GAM TARGET RNA. GAM1105 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15344] GAM1105 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1105 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1105 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1105 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1105 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15345] The complementary binding of GAM1105 RNA, herein designated GAM RNA, to target binding sites on GAM1105 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1105 target RNA, herein designated GAM TARGET RNA, into GAM1105 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15346] It is appreciated that GAM1105 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1105 target genes. The mRNA of each one of this plurality of GAM1105 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1105 RNA, herein designated GAM RNA, and which when bound by GAM1105 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1105 target proteins.

[15347] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1105 gene, herein designated GAM GENE, on one or more GAM1105 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15348] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1105 correlate with, and may be deduced from, the identity of the target genes which GAM1105 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15349] Nucleotide sequences of the GAM1105 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1105 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1105 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1105 are further described hereinbelow with reference to Table 1.

[15350] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1105 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15351] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1106 (GAM1106) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15352] GAM1106 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1106 was detected is described hereinabove with reference to Figs. 2-8.

[15353] GAM1106 gene, herein designated GAM GENE, and GAM1106 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15354] GAM1106 gene, herein designated GAM GENE, encodes a GAM1106 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1106 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1106 precursor RNA is designated SEQ ID:1083, and is provided hereinbelow with reference to the sequence listing part.

[15355] GAM1106 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15356] An enzyme complex designated DICER COMPLEX, dices the GAM1106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1106 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1106 RNA is designated SEQ ID:3685, and is provided hereinbelow with reference to the sequence listing part.

[15357] GAM1106 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1106 target RNA, herein designated GAM TARGET RNA. GAM1106 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15358] GAM1106 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1106 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1106 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1106 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1106 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15359] The complementary binding of GAM1106 RNA, herein designated GAM RNA, to target binding sites on GAM1106 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1106 target RNA, herein designated GAM TARGET RNA, into GAM1106 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15360] It is appreciated that GAM1106 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1106 target genes. The mRNA of each one of this plurality of GAM1106 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1106 RNA, herein designated GAM RNA, and which when bound by GAM1106 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1106 target proteins.

[15361] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1106 gene, herein designated GAM GENE, on one or more GAM1106 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15362] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1106 correlate with, and may be deduced from, the identity of the target genes which GAM1106 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15363] Nucleotide sequences of the GAM1106 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1106 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1106 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1106 are further described hereinbelow with reference to Table 1.

[15364] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1106 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15365] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1107 (GAM1107) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15366] GAM1107 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1107 was detected is described hereinabove with reference to Figs. 2-8.

[15367] GAM1107 gene, herein designated GAM GENE, and GAM1107 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15368] GAM1107 gene, herein designated GAM GENE, encodes a GAM1107 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1107 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1107 precursor RNA is designated SEQ ID:1084, and is provided hereinbelow with reference to the sequence listing part.

[15369] GAM1107 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1107 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15370] An enzyme complex designated DICER COMPLEX, dices the GAM1107 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1107 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1107 RNA is designated SEQ ID:3686, and is provided hereinbelow with reference to the sequence listing part.

[15371] GAM1107 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1107 target RNA, herein designated GAM TARGET RNA. GAM1107 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15372] GAM1107 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1107 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1107 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1107 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1107 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15373] The complementary binding of GAM1107 RNA, herein designated GAM RNA, to target binding sites on GAM1107 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1107 target RNA, herein designated GAM TARGET RNA, into GAM1107 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15374] It is appreciated that GAM1107 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1107 target genes. The

mRNA of each one of this plurality of GAM1107 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1107 RNA, herein designated GAM RNA, and which when bound by GAM1107 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1107 target proteins.

[15375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1107 gene, herein designated GAM GENE, on one or more GAM1107 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15376] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1107 correlate with, and may be deduced from, the identity of the target genes which GAM1107 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15377] Nucleotide sequences of the GAM1107 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1107 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1107 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1107 are further described hereinbelow with reference to Table 1.

[15378] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1107 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15379] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1108 (GAM1108) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15380] GAM1108 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1108 was detected is described hereinabove with reference to Figs. 2-8.

[15381] GAM1108 gene, herein designated GAM GENE, and GAM1108 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15382] GAM1108 gene, herein designated GAM GENE, encodes a GAM1108 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1108 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1108 precursor RNA is designated SEQ ID:1085, and is provided hereinbelow with reference to the sequence listing part.

[15383] GAM1108 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15384] An enzyme complex designated DICER COMPLEX, dices the GAM1108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1108 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1108 RNA is designated SEQ ID:3687, and is provided hereinbelow with reference to the sequence listing part.

[15385] GAM1108 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1108 target RNA, herein designated GAM TARGET RNA. GAM1108 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15386] GAM1108 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1108 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1108 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1108 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1108 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15387] The complementary binding of GAM1108 RNA, herein designated GAM RNA, to target binding sites on GAM1108 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1108 target RNA, herein designated GAM TARGET RNA, into GAM1108 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15388] It is appreciated that GAM1108 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1108 target genes. The mRNA of each one of this plurality of GAM1108 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1108 RNA, herein designated GAM RNA, and which when bound by GAM1108 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1108 target proteins.

[15389] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1108 gene, herein designated GAM GENE, on one or more GAM1108 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15390] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1108 correlate with, and may be deduced from, the identity of the target

genes which GAM1108 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15391] Nucleotide sequences of the GAM1108 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1108 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1108 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1108 are further described hereinbelow with reference to Table 1.

[15392] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1108 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15393] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1109 (GAM1109) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15394] GAM1109 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1109 was detected is described hereinabove with reference to Figs. 2-8.

[15395] GAM1109 gene, herein designated GAM GENE, and GAM1109 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15396] GAM1109 gene, herein designated GAM GENE, encodes a GAM1109 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1109 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1109 precursor RNA is designated SEQ ID:1086, and is provided hereinbelow with reference to the sequence listing part.

[15397] GAM1109 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15398] An enzyme complex designated DICER COMPLEX, dices the GAM1109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1109 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1109 RNA is designated SEQ ID:3688, and is provided

hereinbelow with reference to the sequence listing part.

[15399] GAM1109 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1109 target RNA, herein designated GAM TARGET RNA. GAM1109 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15400] GAM1109 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1109 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1109 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1109 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1109 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15401] The complementary binding of GAM1109 RNA, herein designated GAM RNA, to target binding sites on GAM1109 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1109 target RNA, herein designated GAM TARGET RNA, into GAM1109 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15402] It is appreciated that GAM1109 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1109 target genes. The mRNA of each one of this plurality of GAM1109 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1109 RNA, herein designated GAM RNA, and which when bound by GAM1109 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1109 target proteins.

[15403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1109 gene, herein designated GAM GENE, on one or more GAM1109 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15404] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1109 correlate with, and may be deduced from, the identity of the target genes which GAM1109 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15405] Nucleotide sequences of the GAM1109 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1109 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1109 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1109 are further described hereinbelow with reference to Table 1.

[15406] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1109 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15407] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1110 (GAM1110) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15408] GAM1110 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1110 was detected is described hereinabove with reference to Figs. 2-8.

[15409] GAM1110 gene, herein designated GAM GENE, and GAM1110 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15410] GAM1110 gene, herein designated GAM GENE, encodes a GAM1110 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1110 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1110 precursor RNA is designated SEQ ID:1087, and is provided hereinbelow with reference to the sequence listing part.

[15411] GAM1110 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15412] An enzyme complex designated DICER COMPLEX, dices the GAM1110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1110 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1110 RNA is designated SEQ ID:3689, and is provided hereinbelow with reference to the sequence listing part.

[15413] GAM1110 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1110 target RNA, herein designated GAM TARGET RNA. GAM1110 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15414] GAM1110 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1110 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1110 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1110 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1110 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15415] The complementary binding of GAM1110 RNA, herein designated GAM RNA, to target binding sites on GAM1110 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1110 target RNA, herein designated GAM TARGET RNA, into GAM1110 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15416] It is appreciated that GAM1110 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1110 target genes. The mRNA of each one of this plurality of GAM1110 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1110 RNA, herein designated GAM RNA, and which when bound by GAM1110 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1110 target proteins.

[15417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1110 gene, herein designated GAM GENE, on one or more GAM1110 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15418] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1110 correlate with, and may be deduced from, the identity of the target genes which GAM1110 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15419] Nucleotide sequences of the GAM1110 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1110 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1110 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1110 are further described hereinbelow with reference to Table 1.

[15420] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1110 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15421] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1111 (GAM1111) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15422] GAM1111 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1111 was detected is described hereinabove with reference to Figs. 2-8.

[15423] GAM1111 gene, herein designated GAM GENE, and GAM1111 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15424] GAM1111 gene, herein designated GAM GENE, encodes a GAM1111 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1111 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1111 precursor RNA is designated SEQ ID:1088, and is provided hereinbelow with reference to the sequence listing part.

[15425] GAM1111 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15426] An enzyme complex designated DICER COMPLEX, dices the GAM1111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1111 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1111 RNA is designated SEQ ID:3690, and is provided hereinbelow with reference to the sequence listing part.

[15427] GAM1111 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1111 target RNA, herein designated GAM TARGET RNA. GAM1111 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15428] GAM1111 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1111 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1111 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1111 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1111 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15429] The complementary binding of GAM1111 RNA, herein designated GAM RNA, to target binding sites on GAM1111 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1111 target RNA, herein designated GAM TARGET RNA, into GAM1111 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15430] It is appreciated that GAM1111 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1111 target genes. The mRNA of each one of this plurality of GAM1111 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1111 RNA, herein designated GAM RNA, and which when bound by GAM1111 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1111 target proteins.

[15431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1111 gene, herein designated GAM GENE, on one or more GAM1111 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15432] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1111 correlate with, and may be deduced from, the identity of the target genes which GAM1111 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15433] Nucleotide sequences of the GAM1111 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1111 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1111 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1111 are further described hereinbelow with reference to Table 1.

[15434] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1111 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15435] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1112 (GAM1112) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15436] GAM1112 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1112 was detected is described hereinabove with reference to Figs. 2-8.

[15437] GAM1112 gene, herein designated GAM GENE, and GAM1112 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15438] GAM1112 gene, herein designated GAM GENE, encodes a GAM1112 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1112 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1112 precursor RNA is designated SEQ ID:1089, and is provided hereinbelow with reference to the sequence listing part.

[15439] GAM1112 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15440] An enzyme complex designated DICER COMPLEX, dices the GAM1112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1112 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1112 RNA is designated SEQ ID:3691, and is provided hereinbelow with reference to the sequence listing part.

[15441] GAM1112 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1112 target RNA, herein designated GAM TARGET RNA. GAM1112 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15442] GAM1112 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1112 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1112 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1112 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1112 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15443] The complementary binding of GAM1112 RNA, herein designated GAM RNA, to target binding sites on GAM1112 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1112 target RNA, herein designated GAM TARGET RNA, into GAM1112 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15444] It is appreciated that GAM1112 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1112 target genes. The mRNA of each one of this plurality of GAM1112 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1112 RNA, herein designated GAM RNA, and which when bound by GAM1112 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1112 target proteins.

[15445] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1112 gene, herein designated GAM GENE, on one or more GAM1112 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15446] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1112 correlate with, and may be deduced from, the identity of the target genes which GAM1112 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15447] Nucleotide sequences of the GAM1112 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1112 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1112 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1112 are further described hereinbelow with reference to Table 1.

[15448] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1112 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15449] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1113 (GAM1113) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15450] GAM1113 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1113 was detected is described hereinabove with reference to Figs. 2-8.

[15451] GAM1113 gene, herein designated GAM GENE, and GAM1113 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15452] GAM1113 gene, herein designated GAM GENE, encodes a GAM1113 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1113 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1113 precursor RNA is designated SEQ ID:1090, and is provided hereinbelow with reference to the sequence listing part.

[15453] GAM1113 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15454] An enzyme complex designated DICER COMPLEX, dices the GAM1113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1113 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1113 RNA is designated SEQ ID:3692, and is provided hereinbelow with reference to the sequence listing part.

[15455] GAM1113 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1113 target RNA, herein designated GAM TARGET RNA. GAM1113 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15456] GAM1113 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1113 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1113 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1113 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1113 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15457] The complementary binding of GAM1113 RNA, herein designated GAM RNA, to target binding sites on GAM1113 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1113 target RNA, herein designated GAM TARGET RNA, into GAM1113 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15458] It is appreciated that GAM1113 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1113 target genes. The

mRNA of each one of this plurality of GAM1113 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1113 RNA, herein designated GAM RNA, and which when bound by GAM1113 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1113 target proteins.

[15459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1113 gene, herein designated GAM GENE, on one or more GAM1113 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15460] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1113 correlate with, and may be deduced from, the identity of the target genes which GAM1113 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15461] Nucleotide sequences of the GAM1113 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1113 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1113 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1113 are further described hereinbelow with reference to Table 1.

[15462] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1113 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15463] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1114 (GAM1114) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15464] GAM1114 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1114 was detected is described hereinabove with reference to Figs. 2-8.

[15465] GAM1114 gene, herein designated GAM GENE, and GAM1114 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15466] GAM1114 gene, herein designated GAM GENE, encodes a GAM1114 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1114 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1114 precursor RNA is designated SEQ ID:1091, and is provided hereinbelow with reference to the sequence listing part.

[15467] GAM1114 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1114 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15468] An enzyme complex designated DICER COMPLEX, dices the GAM1114 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1114 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1114 RNA is designated SEQ ID:3694, and is provided hereinbelow with reference to the sequence listing part.

[15469] GAM1114 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1114 target RNA, herein designated GAM TARGET RNA. GAM1114 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15470] GAM1114 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1114 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1114 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1114 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1114 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15471] The complementary binding of GAM1114 RNA, herein designated GAM RNA, to target binding sites on GAM1114 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1114 target RNA, herein designated GAM TARGET RNA, into GAM1114 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15472] It is appreciated that GAM1114 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1114 target genes. The mRNA of each one of this plurality of GAM1114 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1114 RNA, herein designated GAM RNA, and which when bound by GAM1114 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1114 target proteins.

[15473] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1114 gene, herein designated GAM GENE, on one or more GAM1114 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15474] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1114 correlate with, and may be deduced from, the identity of the target

genes which GAM1114 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15475] Nucleotide sequences of the GAM1114 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1114 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1114 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1114 are further described hereinbelow with reference to Table 1.

[15476] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1114 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15477] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1115 (GAM1115) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15478] GAM1115 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1115 was detected is described hereinabove with reference to Figs. 2-8.

[15479] GAM1115 gene, herein designated GAM GENE, and GAM1115 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15480] GAM1115 gene, herein designated GAM GENE, encodes a GAM1115 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1115 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1115 precursor RNA is designated SEQ ID:1092, and is provided hereinbelow with reference to the sequence listing part.

[15481] GAM1115 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15482] An enzyme complex designated DICER COMPLEX, dices the GAM1115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1115 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1115 RNA is designated SEQ ID:3693, and is provided

hereinbelow with reference to the sequence listing part.

[15483] GAM1115 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1115 target RNA, herein designated GAM TARGET RNA. GAM1115 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15484] GAM1115 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1115 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1115 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1115 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1115 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15485] The complementary binding of GAM1115 RNA, herein designated GAM RNA, to target binding sites on GAM1115 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1115 target RNA, herein designated GAM TARGET RNA, into GAM1115 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15486] It is appreciated that GAM1115 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1115 target genes. The mRNA of each one of this plurality of GAM1115 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1115 RNA, herein designated GAM RNA, and which when bound by GAM1115 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1115 target proteins.

[15487] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1115 gene, herein designated GAM GENE, on one or more GAM1115 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15488] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1115 correlate with, and may be deduced from, the identity of the target genes which GAM1115 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15489] Nucleotide sequences of the GAM1115 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1115 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1115 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1115 are further described hereinbelow with reference to Table 1.

[15490] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1115 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15491] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1116 (GAM1116) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15492] GAM1116 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1116 was detected is described hereinabove with reference to Figs. 2-8.

[15493] GAM1116 gene, herein designated GAM GENE, and GAM1116 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15494] GAM1116 gene, herein designated GAM GENE, encodes a GAM1116 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1116 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1116 precursor RNA is designated SEQ ID:1093, and is provided hereinbelow with reference to the sequence listing part.

[15495] GAM1116 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1116 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15496] An enzyme complex designated DICER COMPLEX, dices the GAM1116 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1116 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1116 RNA is designated SEQ ID:3695, and is provided hereinbelow with reference to the sequence listing part.

[15497] GAM1116 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1116 target RNA, herein designated GAM TARGET RNA. GAM1116 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15498] GAM1116 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1116 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1116 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1116 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1116 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15499] The complementary binding of GAM1116 RNA, herein designated GAM RNA, to target binding sites on GAM1116 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1116 target RNA, herein designated GAM TARGET RNA, into GAM1116 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15500] It is appreciated that GAM1116 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1116 target genes. The mRNA of each one of this plurality of GAM1116 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1116 RNA, herein designated GAM RNA, and which when bound by GAM1116 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1116 target proteins.

[15501] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1116 gene, herein designated GAM GENE, on one or more GAM1116 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15502] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1116 correlate with, and may be deduced from, the identity of the target genes which GAM1116 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15503] Nucleotide sequences of the GAM1116 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1116 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1116 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1116 are further described hereinbelow with reference to Table 1.

[15504] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1116 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15505] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1117 (GAM1117) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15506] GAM1117 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1117 was detected is described hereinabove with reference to Figs. 2-8.

[15507] GAM1117 gene, herein designated GAM GENE, and GAM1117 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15508] GAM1117 gene, herein designated GAM GENE, encodes a GAM1117 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1117 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1117 precursor RNA is designated SEQ ID:1094, and is provided hereinbelow with reference to the sequence listing part.

[15509] GAM1117 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1117 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15510] An enzyme complex designated DICER COMPLEX, dices the GAM1117 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1117 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1117 RNA is designated SEQ ID:3696, and is provided hereinbelow with reference to the sequence listing part.

[15511] GAM1117 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1117 target RNA, herein designated GAM TARGET RNA. GAM1117 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15512] GAM1117 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1117 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1117 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1117 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1117 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15513] The complementary binding of GAM1117 RNA, herein designated GAM RNA, to target binding sites on GAM1117 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1117 target RNA, herein designated GAM TARGET RNA, into GAM1117 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15514] It is appreciated that GAM1117 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1117 target genes. The mRNA of each one of this plurality of GAM1117 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1117 RNA, herein designated GAM RNA, and which when bound by GAM1117 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1117 target proteins.

[15515] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1117 gene, herein designated GAM GENE, on one or more GAM1117 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15516] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1117 correlate with, and may be deduced from, the identity of the target genes which GAM1117 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15517] Nucleotide sequences of the GAM1117 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1117 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1117 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1117 are further described hereinbelow with reference to Table 1.

[15518] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1117 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15519] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1118 (GAM1118) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15520] GAM1118 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1118 was detected is described hereinabove with reference to Figs. 2-8.

[15521] GAM1118 gene, herein designated GAM GENE, and GAM1118 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15522] GAM1118 gene, herein designated GAM GENE, encodes a GAM1118 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1118 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1118 precursor RNA is designated SEQ ID:1095, and is provided hereinbelow with reference to the sequence listing part.

[15523] GAM1118 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15524] An enzyme complex designated DICER COMPLEX, dices the GAM1118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1118 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1118 RNA is designated SEQ ID:3697, and is provided hereinbelow with reference to the sequence listing part.

[15525] GAM1118 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1118 target RNA, herein designated GAM TARGET RNA. GAM1118 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15526] GAM1118 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1118 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1118 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1118 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1118 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15527] The complementary binding of GAM1118 RNA, herein designated GAM RNA, to target binding sites on GAM1118 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1118 target RNA, herein designated GAM TARGET RNA, into GAM1118 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15528] It is appreciated that GAM1118 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1118 target genes. The mRNA of each one of this plurality of GAM1118 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1118 RNA, herein designated GAM RNA, and which when bound by GAM1118 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1118 target proteins.

[15529] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1118 gene, herein designated GAM GENE, on one or more GAM1118 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15530] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1118 correlate with, and may be deduced from, the identity of the target genes which GAM1118 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15531] Nucleotide sequences of the GAM1118 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1118 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1118 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1118 are further described hereinbelow with reference to Table 1.

[15532] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1118 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15533] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1119 (GAM1119) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15534] GAM1119 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1119 was detected is described hereinabove with reference to Figs. 2-8.

[15535] GAM1119 gene, herein designated GAM GENE, and GAM1119 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15536] GAM1119 gene, herein designated GAM GENE, encodes a GAM1119 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1119 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1119 precursor RNA is designated SEQ ID:1096, and is provided hereinbelow with reference to the sequence listing part.

[15537] GAM1119 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15538] An enzyme complex designated DICER COMPLEX, dices the GAM1119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1119 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1119 RNA is designated SEQ ID:3698, and is provided hereinbelow with reference to the sequence listing part.

[15539] GAM1119 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1119 target RNA, herein designated GAM TARGET RNA. GAM1119 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15540] GAM1119 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1119 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1119 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1119 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1119 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15541] The complementary binding of GAM1119 RNA, herein designated GAM RNA, to target binding sites on GAM1119 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1119 target RNA, herein designated GAM TARGET RNA, into GAM1119 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15542] It is appreciated that GAM1119 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1119 target genes. The

mRNA of each one of this plurality of GAM1119 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1119 RNA, herein designated GAM RNA, and which when bound by GAM1119 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1119 target proteins.

[15543] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1119 gene, herein designated GAM GENE, on one or more GAM1119 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15544] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1119 correlate with, and may be deduced from, the identity of the target genes which GAM1119 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15545] Nucleotide sequences of the GAM1119 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1119 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1119 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1119 are further described hereinbelow with reference to Table 1.

[15546] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1119 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15547] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1120 (GAM1120) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15548] GAM1120 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1120 was detected is described hereinabove with reference to Figs. 2-8.

[15549] GAM1120 gene, herein designated GAM GENE, and GAM1120 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15550] GAM1120 gene, herein designated GAM GENE, encodes a GAM1120 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1120 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1120 precursor RNA is designated SEQ ID:1097, and is provided hereinbelow with reference to the sequence listing part.

[15551] GAM1120 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1120 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15552] An enzyme complex designated DICER COMPLEX, dices the GAM1120 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1120 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1120 RNA is designated SEQ ID:3699, and is provided hereinbelow with reference to the sequence listing part.

[15553] GAM1120 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1120 target RNA, herein designated GAM TARGET RNA. GAM1120 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15554] GAM1120 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1120 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1120 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1120 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1120 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15555] The complementary binding of GAM1120 RNA, herein designated GAM RNA, to target binding sites on GAM1120 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1120 target RNA, herein designated GAM TARGET RNA, into GAM1120 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15556] It is appreciated that GAM1120 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1120 target genes. The mRNA of each one of this plurality of GAM1120 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1120 RNA, herein designated GAM RNA, and which when bound by GAM1120 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1120 target proteins.

[15557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1120 gene, herein designated GAM GENE, on one or more GAM1120 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15558] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1120 correlate with, and may be deduced from, the identity of the target

genes which GAM1120 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15559] Nucleotide sequences of the GAM1120 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1120 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1120 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1120 are further described hereinbelow with reference to Table 1.

[15560] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1120 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15561] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1121 (GAM1121) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15562] GAM1121 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1121 was detected is described hereinabove with reference to Figs. 2-8.

[15563] GAM1121 gene, herein designated GAM GENE, and GAM1121 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15564] GAM1121 gene, herein designated GAM GENE, encodes a GAM1121 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1121 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1121 precursor RNA is designated SEQ ID:1098, and is provided hereinbelow with reference to the sequence listing part.

[15565] GAM1121 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15566] An enzyme complex designated DICER COMPLEX, dices the GAM1121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1121 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1121 RNA is designated SEQ ID:3700, and is provided

hereinbelow with reference to the sequence listing part.

[15567] GAM1121 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1121 target RNA, herein designated GAM TARGET RNA. GAM1121 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15568] GAM1121 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1121 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1121 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1121 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1121 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15569] The complementary binding of GAM1121 RNA, herein designated GAM RNA, to target binding sites on GAM1121 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1121 target RNA, herein designated GAM TARGET RNA, into GAM1121 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15570] It is appreciated that GAM1121 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1121 target genes. The mRNA of each one of this plurality of GAM1121 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1121 RNA, herein designated GAM RNA, and which when bound by GAM1121 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1121 target proteins.

[15571] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1121 gene, herein designated GAM GENE, on one or more GAM1121 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15572] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1121 correlate with, and may be deduced from, the identity of the target genes which GAM1121 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15573] Nucleotide sequences of the GAM1121 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1121 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1121 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1121 are further described hereinbelow with reference to Table 1.

[15574] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1121 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15575] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1122 (GAM1122) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15576] GAM1122 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1122 was detected is described hereinabove with reference to Figs. 2-8.

[15577] GAM1122 gene, herein designated GAM GENE, and GAM1122 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15578] GAM1122 gene, herein designated GAM GENE, encodes a GAM1122 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1122 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1122 precursor RNA is designated SEQ ID:1099, and is provided hereinbelow with reference to the sequence listing part.

[15579] GAM1122 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1122 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15580] An enzyme complex designated DICER COMPLEX, dices the GAM1122 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1122 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1122 RNA is designated SEQ ID:3701, and is provided hereinbelow with reference to the sequence listing part.

[15581] GAM1122 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1122 target RNA, herein designated GAM TARGET RNA. GAM1122 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15582] GAM1122 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1122 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1122 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1122 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1122 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15583] The complementary binding of GAM1122 RNA, herein designated GAM RNA, to target binding sites on GAM1122 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1122 target RNA, herein designated GAM TARGET RNA, into GAM1122 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15584] It is appreciated that GAM1122 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1122 target genes. The mRNA of each one of this plurality of GAM1122 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1122 RNA, herein designated GAM RNA, and which when bound by GAM1122 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1122 target proteins.

[15585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1122 gene, herein designated GAM GENE, on one or more GAM1122 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15586] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1122 correlate with, and may be deduced from, the identity of the target genes which GAM1122 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15587] Nucleotide sequences of the GAM1122 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1122 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1122 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1122 are further described hereinbelow with reference to Table 1.

[15588] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1122 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15589] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1123 (GAM1123) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15590] GAM1123 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1123 was detected is described hereinabove with reference to Figs. 2-8.

[15591] GAM1123 gene, herein designated GAM GENE, and GAM1123 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15592] GAM1123 gene, herein designated GAM GENE, encodes a GAM1123 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1123 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1123 precursor RNA is designated SEQ ID:1100, and is provided hereinbelow with reference to the sequence listing part.

[15593] GAM1123 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15594] An enzyme complex designated DICER COMPLEX, dices the GAM1123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1123 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1123 RNA is designated SEQ ID:3702, and is provided hereinbelow with reference to the sequence listing part.

[15595] GAM1123 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1123 target RNA, herein designated GAM TARGET RNA. GAM1123 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15596] GAM1123 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1123 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1123 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1123 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1123 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15597] The complementary binding of GAM1123 RNA, herein designated GAM RNA, to target binding sites on GAM1123 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1123 target RNA, herein designated GAM TARGET RNA, into GAM1123 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15598] It is appreciated that GAM1123 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1123 target genes. The mRNA of each one of this plurality of GAM1123 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1123 RNA, herein designated GAM RNA, and which when bound by GAM1123 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1123 target proteins.

[15599] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1123 gene, herein designated GAM GENE, on one or more GAM1123 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15600] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1123 correlate with, and may be deduced from, the identity of the target genes which GAM1123 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15601] Nucleotide sequences of the GAM1123 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1123 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1123 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1123 are further described hereinbelow with reference to Table 1.

[15602] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1123 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15603] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1124 (GAM1124) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15604] GAM1124 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1124 was detected is described hereinabove with reference to Figs. 2-8.

[15605] GAM1124 gene, herein designated GAM GENE, and GAM1124 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15606] GAM1124 gene, herein designated GAM GENE, encodes a GAM1124 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1124 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1124 precursor RNA is designated SEQ ID:1101, and is provided hereinbelow with reference to the sequence listing part.

[15607] GAM1124 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15608] An enzyme complex designated DICER COMPLEX, dices the GAM1124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1124 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1124 RNA is designated SEQ ID:3703, and is provided hereinbelow with reference to the sequence listing part.

[15609] GAM1124 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1124 target RNA, herein designated GAM TARGET RNA. GAM1124 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15610] GAM1124 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1124 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1124 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1124 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1124 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15611] The complementary binding of GAM1124 RNA, herein designated GAM RNA, to target binding sites on GAM1124 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1124 target RNA, herein designated GAM TARGET RNA, into GAM1124 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15612] It is appreciated that GAM1124 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1124 target genes. The mRNA of each one of this plurality of GAM1124 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1124 RNA, herein designated GAM RNA, and which when bound by GAM1124 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1124 target proteins.

[15613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1124 gene, herein designated GAM GENE, on one or more GAM1124 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15614] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1124 correlate with, and may be deduced from, the identity of the target genes which GAM1124 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15615] Nucleotide sequences of the GAM1124 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1124 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1124 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1124 are further described hereinbelow with reference to Table 1.

[15616] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1124 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15617] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1125 (GAM1125) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15618] GAM1125 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1125 was detected is described hereinabove with reference to Figs. 2-8.

[15619] GAM1125 gene, herein designated GAM GENE, and GAM1125 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15620] GAM1125 gene, herein designated GAM GENE, encodes a GAM1125 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1125 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1125 precursor RNA is designated SEQ ID:1102, and is provided hereinbelow with reference to the sequence listing part.

[15621] GAM1125 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15622] An enzyme complex designated DICER COMPLEX, dices the GAM1125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1125 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1125 RNA is designated SEQ ID:3704, and is provided hereinbelow with reference to the sequence listing part.

[15623] GAM1125 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1125 target RNA, herein designated GAM TARGET RNA. GAM1125 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15624] GAM1125 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1125 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1125 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1125 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1125 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15625] The complementary binding of GAM1125 RNA, herein designated GAM RNA, to target binding sites on GAM1125 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1125 target RNA, herein designated GAM TARGET RNA, into GAM1125 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15626] It is appreciated that GAM1125 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1125 target genes. The

mRNA of each one of this plurality of GAM1125 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1125 RNA, herein designated GAM RNA, and which when bound by GAM1125 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1125 target proteins.

[15627] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1125 gene, herein designated GAM GENE, on one or more GAM1125 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15628] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1125 correlate with, and may be deduced from, the identity of the target genes which GAM1125 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15629] Nucleotide sequences of the GAM1125 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1125 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1125 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1125 are further described hereinbelow with reference to Table 1.

[15630] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1125 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15631] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1126 (GAM1126) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15632] GAM1126 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1126 was detected is described hereinabove with reference to Figs. 2-8.

[15633] GAM1126 gene, herein designated GAM GENE, and GAM1126 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15634] GAM1126 gene, herein designated GAM GENE, encodes a GAM1126 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1126 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1126 precursor RNA is designated SEQ ID:1103, and is provided hereinbelow with reference to the sequence listing part.

[15635] GAM1126 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15636] An enzyme complex designated DICER COMPLEX, dices the GAM1126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1126 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1126 RNA is designated SEQ ID:3705, and is provided hereinbelow with reference to the sequence listing part.

[15637] GAM1126 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1126 target RNA, herein designated GAM TARGET RNA. GAM1126 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15638] GAM1126 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1126 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1126 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1126 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1126 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15639] The complementary binding of GAM1126 RNA, herein designated GAM RNA, to target binding sites on GAM1126 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1126 target RNA, herein designated GAM TARGET RNA, into GAM1126 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15640] It is appreciated that GAM1126 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1126 target genes. The mRNA of each one of this plurality of GAM1126 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1126 RNA, herein designated GAM RNA, and which when bound by GAM1126 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1126 target proteins.

[15641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1126 gene, herein designated GAM GENE, on one or more GAM1126 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15642] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1126 correlate with, and may be deduced from, the identity of the target

genes which GAM1126 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15643] Nucleotide sequences of the GAM1126 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1126 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1126 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1126 are further described hereinbelow with reference to Table 1.

[15644] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1126 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15645] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1127 (GAM1127) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15646] GAM1127 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1127 was detected is described hereinabove with reference to Figs. 2-8.

[15647] GAM1127 gene, herein designated GAM GENE, and GAM1127 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15648] GAM1127 gene, herein designated GAM GENE, encodes a GAM1127 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1127 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1127 precursor RNA is designated SEQ ID:1104, and is provided hereinbelow with reference to the sequence listing part.

[15649] GAM1127 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15650] An enzyme complex designated DICER COMPLEX, dices the GAM1127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1127 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1127 RNA is designated SEQ ID:3706, and is provided

hereinbelow with reference to the sequence listing part.

[15651] GAM1127 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1127 target RNA, herein designated GAM TARGET RNA. GAM1127 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15652] GAM1127 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1127 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1127 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1127 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1127 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15653] The complementary binding of GAM1127 RNA, herein designated GAM RNA, to target binding sites on GAM1127 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1127 target RNA, herein designated GAM TARGET RNA, into GAM1127 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15654] It is appreciated that GAM1127 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1127 target genes. The mRNA of each one of this plurality of GAM1127 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1127 RNA, herein designated GAM RNA, and which when bound by GAM1127 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1127 target proteins.

[15655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1127 gene, herein designated GAM GENE, on one or more GAM1127 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15656] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1127 correlate with, and may be deduced from, the identity of the target genes which GAM1127 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15657] Nucleotide sequences of the GAM1127 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1127 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1127 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1127 are further described hereinbelow with reference to Table 1.

[15658] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1127 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15659] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1128 (GAM1128) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15660] GAM1128 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1128 was detected is described hereinabove with reference to Figs. 2-8.

[15661] GAM1128 gene, herein designated GAM GENE, and GAM1128 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15662] GAM1128 gene, herein designated GAM GENE, encodes a GAM1128 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1128 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1128 precursor RNA is designated SEQ ID:1105, and is provided hereinbelow with reference to the sequence listing part.

[15663] GAM1128 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15664] An enzyme complex designated DICER COMPLEX, dices the GAM1128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1128 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1128 RNA is designated SEQ ID:3707, and is provided hereinbelow with reference to the sequence listing part.

[15665] GAM1128 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1128 target RNA, herein designated GAM TARGET RNA. GAM1128 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15666] GAM1128 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1128 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1128 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1128 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1128 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15667] The complementary binding of GAM1128 RNA, herein designated GAM RNA, to target binding sites on GAM1128 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1128 target RNA, herein designated GAM TARGET RNA, into GAM1128 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15668] It is appreciated that GAM1128 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1128 target genes. The mRNA of each one of this plurality of GAM1128 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1128 RNA, herein designated GAM RNA, and which when bound by GAM1128 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1128 target proteins.

[15669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1128 gene, herein designated GAM GENE, on one or more GAM1128 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15670] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1128 correlate with, and may be deduced from, the identity of the target genes which GAM1128 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15671] Nucleotide sequences of the GAM1128 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1128 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1128 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1128 are further described hereinbelow with reference to Table 1.

[15672] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1128 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15673] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1129 (GAM1129) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15674] GAM1129 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1129 was detected is described hereinabove with reference to Figs. 2-8.

[15675] GAM1129 gene, herein designated GAM GENE, and GAM1129 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15676] GAM1129 gene, herein designated GAM GENE, encodes a GAM1129 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1129 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1129 precursor RNA is designated SEQ ID:1106, and is provided hereinbelow with reference to the sequence listing part.

[15677] GAM1129 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15678] An enzyme complex designated DICER COMPLEX, dices the GAM1129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1129 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1129 RNA is designated SEQ ID:3708, and is provided hereinbelow with reference to the sequence listing part.

[15679] GAM1129 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1129 target RNA, herein designated GAM TARGET RNA. GAM1129 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15680] GAM1129 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1129 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1129 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1129 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1129 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15681] The complementary binding of GAM1129 RNA, herein designated GAM RNA, to target binding sites on GAM1129 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1129 target RNA, herein designated GAM TARGET RNA, into GAM1129 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15682] It is appreciated that GAM1129 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1129 target genes. The mRNA of each one of this plurality of GAM1129 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1129 RNA, herein designated GAM RNA, and which when bound by GAM1129 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1129 target proteins.

[15683] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1129 gene, herein designated GAM GENE, on one or more GAM1129 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15684] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1129 correlate with, and may be deduced from, the identity of the target genes which GAM1129 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15685] Nucleotide sequences of the GAM1129 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1129 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1129 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1129 are further described hereinbelow with reference to Table 1.

[15686] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1129 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15687] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1130 (GAM1130) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15688] GAM1130 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1130 was detected is described hereinabove with reference to Figs. 2-8.

[15689] GAM1130 gene, herein designated GAM GENE, and GAM1130 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15690] GAM1130 gene, herein designated GAM GENE, encodes a GAM1130 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1130 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1130 precursor RNA is designated SEQ ID:1107, and is provided hereinbelow with reference to the sequence listing part.

[15691] GAM1130 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15692] An enzyme complex designated DICER COMPLEX, dices the GAM1130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1130 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1130 RNA is designated SEQ ID:3709, and is provided hereinbelow with reference to the sequence listing part.

[15693] GAM1130 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1130 target RNA, herein designated GAM TARGET RNA. GAM1130 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15694] GAM1130 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1130 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1130 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1130 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1130 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15695] The complementary binding of GAM1130 RNA, herein designated GAM RNA, to target binding sites on GAM1130 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1130 target RNA, herein designated GAM TARGET RNA, into GAM1130 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15696] It is appreciated that GAM1130 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1130 target genes. The mRNA of each one of this plurality of GAM1130 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1130 RNA, herein designated GAM RNA, and which when bound by GAM1130 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1130 target proteins.

[15697] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1130 gene, herein designated GAM GENE, on one or more GAM1130 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15698] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1130 correlate with, and may be deduced from, the identity of the target genes which GAM1130 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15699] Nucleotide sequences of the GAM1130 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1130 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1130 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1130 are further described hereinbelow with reference to Table 1.

[15700] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1130 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15701] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1131 (GAM1131) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15702] GAM1131 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1131 was detected is described hereinabove with reference to Figs. 2-8.

[15703] GAM1131 gene, herein designated GAM GENE, and GAM1131 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15704] GAM1131 gene, herein designated GAM GENE, encodes a GAM1131 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1131 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1131 precursor RNA is designated SEQ ID:1108, and is provided hereinbelow with reference to the sequence listing part.

[15705] GAM1131 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15706] An enzyme complex designated DICER COMPLEX, dices the GAM1131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1131 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1131 RNA is designated SEQ ID:3710, and is provided hereinbelow with reference to the sequence listing part.

[15707] GAM1131 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1131 target RNA, herein designated GAM TARGET RNA. GAM1131 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15708] GAM1131 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1131 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1131 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1131 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1131 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15709] The complementary binding of GAM1131 RNA, herein designated GAM RNA, to target binding sites on GAM1131 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1131 target RNA, herein designated GAM TARGET RNA, into GAM1131 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15710] It is appreciated that GAM1131 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1131 target genes. The

mRNA of each one of this plurality of GAM1131 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1131 RNA, herein designated GAM RNA, and which when bound by GAM1131 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1131 target proteins.

[15711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1131 gene, herein designated GAM GENE, on one or more GAM1131 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15712] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1131 correlate with, and may be deduced from, the identity of the target genes which GAM1131 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15713] Nucleotide sequences of the GAM1131 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1131 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1131 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1131 are further described hereinbelow with reference to Table 1.

[15714] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1131 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15715] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1132 (GAM1132) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15716] GAM1132 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1132 was detected is described hereinabove with reference to Figs. 2-8.

[15717] GAM1132 gene, herein designated GAM GENE, and GAM1132 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15718] GAM1132 gene, herein designated GAM GENE, encodes a GAM1132 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1132 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1132 precursor RNA is designated SEQ ID:1109, and is provided hereinbelow with reference to the sequence listing part.

[15719] GAM1132 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15720] An enzyme complex designated DICER COMPLEX, dices the GAM1132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1132 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1132 RNA is designated SEQ ID:3711, and is provided hereinbelow with reference to the sequence listing part.

[15721] GAM1132 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1132 target RNA, herein designated GAM TARGET RNA. GAM1132 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15722] GAM1132 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1132 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1132 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1132 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1132 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15723] The complementary binding of GAM1132 RNA, herein designated GAM RNA, to target binding sites on GAM1132 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1132 target RNA, herein designated GAM TARGET RNA, into GAM1132 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15724] It is appreciated that GAM1132 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1132 target genes. The mRNA of each one of this plurality of GAM1132 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1132 RNA, herein designated GAM RNA, and which when bound by GAM1132 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1132 target proteins.

[15725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1132 gene, herein designated GAM GENE, on one or more GAM1132 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15726] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1132 correlate with, and may be deduced from, the identity of the target

genes which GAM1132 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15727] Nucleotide sequences of the GAM1132 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1132 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1132 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1132 are further described hereinbelow with reference to Table 1.

[15728] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1132 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15729] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1133 (GAM1133) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15730] GAM1133 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1133 was detected is described hereinabove with reference to Figs. 2-8.

[15731] GAM1133 gene, herein designated GAM GENE, and GAM1133 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15732] GAM1133 gene, herein designated GAM GENE, encodes a GAM1133 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1133 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1133 precursor RNA is designated SEQ ID:1110, and is provided hereinbelow with reference to the sequence listing part.

[15733] GAM1133 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15734] An enzyme complex designated DICER COMPLEX, dices the GAM1133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1133 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1133 RNA is designated SEQ ID:3712, and is provided

hereinbelow with reference to the sequence listing part.

[15735] GAM1133 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1133 target RNA, herein designated GAM TARGET RNA. GAM1133 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15736] GAM1133 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1133 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1133 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1133 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1133 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15737] The complementary binding of GAM1133 RNA, herein designated GAM RNA, to target binding sites on GAM1133 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1133 target RNA, herein designated GAM TARGET RNA, into GAM1133 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15738] It is appreciated that GAM1133 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1133 target genes. The mRNA of each one of this plurality of GAM1133 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1133 RNA, herein designated GAM RNA, and which when bound by GAM1133 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1133 target proteins.

[15739] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1133 gene, herein designated GAM GENE, on one or more GAM1133 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15740] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1133 correlate with, and may be deduced from, the identity of the target genes which GAM1133 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15741] Nucleotide sequences of the GAM1133 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1133 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1133 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1133 are further described hereinbelow with reference to Table 1.

[15742] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1133 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15743] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1134 (GAM1134) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15744] GAM1134 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1134 was detected is described hereinabove with reference to Figs. 2-8.

[15745] GAM1134 gene, herein designated GAM GENE, and GAM1134 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15746] GAM1134 gene, herein designated GAM GENE, encodes a GAM1134 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1134 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1134 precursor RNA is designated SEQ ID:1111, and is provided hereinbelow with reference to the sequence listing part.

[15747] GAM1134 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15748] An enzyme complex designated DICER COMPLEX, dices the GAM1134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1134 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1134 RNA is designated SEQ ID:3713, and is provided hereinbelow with reference to the sequence listing part.

[15749] GAM1134 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1134 target RNA, herein designated GAM TARGET RNA. GAM1134 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15750] GAM1134 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1134 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1134 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1134 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1134 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15751] The complementary binding of GAM1134 RNA, herein designated GAM RNA, to target binding sites on GAM1134 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1134 target RNA, herein designated GAM TARGET RNA, into GAM1134 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15752] It is appreciated that GAM1134 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1134 target genes. The mRNA of each one of this plurality of GAM1134 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1134 RNA, herein designated GAM RNA, and which when bound by GAM1134 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1134 target proteins.

[15753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1134 gene, herein designated GAM GENE, on one or more GAM1134 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15754] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1134 correlate with, and may be deduced from, the identity of the target genes which GAM1134 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15755] Nucleotide sequences of the GAM1134 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1134 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1134 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1134 are further described hereinbelow with reference to Table 1.

[15756] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1134 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15757] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1135 (GAM1135) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15758] GAM1135 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1135 was detected is described hereinabove with reference to Figs. 2-8.

[15759] GAM1135 gene, herein designated GAM GENE, and GAM1135 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15760] GAM1135 gene, herein designated GAM GENE, encodes a GAM1135 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1135 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1135 precursor RNA is designated SEQ ID:1112, and is provided hereinbelow with reference to the sequence listing part.

[15761] GAM1135 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15762] An enzyme complex designated DICER COMPLEX, dices the GAM1135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1135 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1135 RNA is designated SEQ ID:3714, and is provided hereinbelow with reference to the sequence listing part.

[15763] GAM1135 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1135 target RNA, herein designated GAM TARGET RNA. GAM1135 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15764] GAM1135 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1135 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1135 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1135 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1135 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15765] The complementary binding of GAM1135 RNA, herein designated GAM RNA, to target binding sites on GAM1135 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1135 target RNA, herein designated GAM TARGET RNA, into GAM1135 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15766] It is appreciated that GAM1135 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1135 target genes. The mRNA of each one of this plurality of GAM1135 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1135 RNA, herein designated GAM RNA, and which when bound by GAM1135 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1135 target proteins.

[15767] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1135 gene, herein designated GAM GENE, on one or more GAM1135 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15768] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1135 correlate with, and may be deduced from, the identity of the target genes which GAM1135 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15769] Nucleotide sequences of the GAM1135 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1135 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1135 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1135 are further described hereinbelow with reference to Table 1.

[15770] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1135 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15771] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1136 (GAM1136) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15772] GAM1136 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1136 was detected is described hereinabove with reference to Figs. 2-8.

[15773] GAM1136 gene, herein designated GAM GENE, and GAM1136 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15774] GAM1136 gene, herein designated GAM GENE, encodes a GAM1136 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1136 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1136 precursor RNA is designated SEQ ID:1113, and is provided hereinbelow with reference to the sequence listing part.

[15775] GAM1136 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15776] An enzyme complex designated DICER COMPLEX, dices the GAM1136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1136 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1136 RNA is designated SEQ ID:3715, and is provided hereinbelow with reference to the sequence listing part.

[15777] GAM1136 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1136 target RNA, herein designated GAM TARGET RNA. GAM1136 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15778] GAM1136 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1136 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1136 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1136 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1136 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15779] The complementary binding of GAM1136 RNA, herein designated GAM RNA, to target binding sites on GAM1136 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1136 target RNA, herein designated GAM TARGET RNA, into GAM1136 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15780] It is appreciated that GAM1136 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1136 target genes. The mRNA of each one of this plurality of GAM1136 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1136 RNA, herein designated GAM RNA, and which when bound by GAM1136 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1136 target proteins.

[15781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1136 gene, herein designated GAM GENE, on one or more GAM1136 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15782] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1136 correlate with, and may be deduced from, the identity of the target genes which GAM1136 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15783] Nucleotide sequences of the GAM1136 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1136 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1136 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1136 are further described hereinbelow with reference to Table 1.

[15784] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1136 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15785] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1137 (GAM1137) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15786] GAM1137 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1137 was detected is described hereinabove with reference to Figs. 2-8.

[15787] GAM1137 gene, herein designated GAM GENE, and GAM1137 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15788] GAM1137 gene, herein designated GAM GENE, encodes a GAM1137 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1137 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1137 precursor RNA is designated SEQ ID:1114, and is provided hereinbelow with reference to the sequence listing part.

[15789] GAM1137 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15790] An enzyme complex designated DICER COMPLEX, dices the GAM1137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1137 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1137 RNA is designated SEQ ID:3716, and is provided hereinbelow with reference to the sequence listing part.

[15791] GAM1137 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1137 target RNA, herein designated GAM TARGET RNA. GAM1137 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15792] GAM1137 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1137 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1137 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1137 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1137 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15793] The complementary binding of GAM1137 RNA, herein designated GAM RNA, to target binding sites on GAM1137 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1137 target RNA, herein designated GAM TARGET RNA, into GAM1137 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15794] It is appreciated that GAM1137 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1137 target genes. The

mRNA of each one of this plurality of GAM1137 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1137 RNA, herein designated GAM RNA, and which when bound by GAM1137 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1137 target proteins.

[15795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1137 gene, herein designated GAM GENE, on one or more GAM1137 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15796] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1137 correlate with, and may be deduced from, the identity of the target genes which GAM1137 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15797] Nucleotide sequences of the GAM1137 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1137 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1137 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1137 are further described hereinbelow with reference to Table 1.

[15798] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1137 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15799] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1138 (GAM1138) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15800] GAM1138 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1138 was detected is described hereinabove with reference to Figs. 2-8.

[15801] GAM1138 gene, herein designated GAM GENE, and GAM1138 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15802] GAM1138 gene, herein designated GAM GENE, encodes a GAM1138 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1138 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1138 precursor RNA is designated SEQ ID:1115, and is provided hereinbelow with reference to the sequence listing part.

[15803] GAM1138 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15804] An enzyme complex designated DICER COMPLEX, dices the GAM1138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1138 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1138 RNA is designated SEQ ID:3717, and is provided hereinbelow with reference to the sequence listing part.

[15805] GAM1138 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1138 target RNA, herein designated GAM TARGET RNA. GAM1138 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15806] GAM1138 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1138 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1138 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1138 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1138 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15807] The complementary binding of GAM1138 RNA, herein designated GAM RNA, to target binding sites on GAM1138 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1138 target RNA, herein designated GAM TARGET RNA, into GAM1138 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15808] It is appreciated that GAM1138 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1138 target genes. The mRNA of each one of this plurality of GAM1138 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1138 RNA, herein designated GAM RNA, and which when bound by GAM1138 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1138 target proteins.

[15809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1138 gene, herein designated GAM GENE, on one or more GAM1138 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15810] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1138 correlate with, and may be deduced from, the identity of the target

genes which GAM1138 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15811] Nucleotide sequences of the GAM1138 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1138 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1138 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1138 are further described hereinbelow with reference to Table 1.

[15812] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1138 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15813] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1139 (GAM1139) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15814] GAM1139 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1139 was detected is described hereinabove with reference to Figs. 2-8.

[15815] GAM1139 gene, herein designated GAM GENE, and GAM1139 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15816] GAM1139 gene, herein designated GAM GENE, encodes a GAM1139 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1139 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1139 precursor RNA is designated SEQ ID:1116, and is provided hereinbelow with reference to the sequence listing part.

[15817] GAM1139 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15818] An enzyme complex designated DICER COMPLEX, dices the GAM1139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1139 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1139 RNA is designated SEQ ID:3718, and is provided

hereinbelow with reference to the sequence listing part.

[15819] GAM1139 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1139 target RNA, herein designated GAM TARGET RNA. GAM1139 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15820] GAM1139 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1139 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1139 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1139 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1139 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15821] The complementary binding of GAM1139 RNA, herein designated GAM RNA, to target binding sites on GAM1139 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1139 target RNA, herein designated GAM TARGET RNA, into GAM1139 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15822] It is appreciated that GAM1139 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1139 target genes. The mRNA of each one of this plurality of GAM1139 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1139 RNA, herein designated GAM RNA, and which when bound by GAM1139 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1139 target proteins.

[15823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1139 gene, herein designated GAM GENE, on one or more GAM1139 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15824] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1139 correlate with, and may be deduced from, the identity of the target genes which GAM1139 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15825] Nucleotide sequences of the GAM1139 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1139 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1139 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1139 are further described hereinbelow with reference to Table 1.

[15826] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1139 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15827] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1140 (GAM1140) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15828] GAM1140 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1140 was detected is described hereinabove with reference to Figs. 2-8.

[15829] GAM1140 gene, herein designated GAM GENE, and GAM1140 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15830] GAM1140 gene, herein designated GAM GENE, encodes a GAM1140 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1140 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1140 precursor RNA is designated SEQ ID:1117, and is provided hereinbelow with reference to the sequence listing part.

[15831] GAM1140 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15832] An enzyme complex designated DICER COMPLEX, dices the GAM1140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1140 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1140 RNA is designated SEQ ID:3719, and is provided hereinbelow with reference to the sequence listing part.

[15833] GAM1140 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1140 target RNA, herein designated GAM TARGET RNA. GAM1140 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15834] GAM1140 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1140 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1140 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1140 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1140 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15835] The complementary binding of GAM1140 RNA, herein designated GAM RNA, to target binding sites on GAM1140 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1140 target RNA, herein designated GAM TARGET RNA, into GAM1140 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15836] It is appreciated that GAM1140 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1140 target genes. The mRNA of each one of this plurality of GAM1140 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1140 RNA, herein designated GAM RNA, and which when bound by GAM1140 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1140 target proteins.

[15837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1140 gene, herein designated GAM GENE, on one or more GAM1140 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15838] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1140 correlate with, and may be deduced from, the identity of the target genes which GAM1140 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15839] Nucleotide sequences of the GAM1140 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1140 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1140 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1140 are further described hereinbelow with reference to Table 1.

[15840] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1140 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15841] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1141 (GAM1141) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15842] GAM1141 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1141 was detected is described hereinabove with reference to Figs. 2-8.

[15843] GAM1141 gene, herein designated GAM GENE, and GAM1141 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15844] GAM1141 gene, herein designated GAM GENE, encodes a GAM1141 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1141 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1141 precursor RNA is designated SEQ ID:1118, and is provided hereinbelow with reference to the sequence listing part.

[15845] GAM1141 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1141 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15846] An enzyme complex designated DICER COMPLEX, dices the GAM1141 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1141 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1141 RNA is designated SEQ ID:3720, and is provided hereinbelow with reference to the sequence listing part.

[15847] GAM1141 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1141 target RNA, herein designated GAM TARGET RNA. GAM1141 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15848] GAM1141 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1141 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1141 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1141 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1141 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15849] The complementary binding of GAM1141 RNA, herein designated GAM RNA, to target binding sites on GAM1141 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1141 target RNA, herein designated GAM TARGET RNA, into GAM1141 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15850] It is appreciated that GAM1141 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1141 target genes. The mRNA of each one of this plurality of GAM1141 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1141 RNA, herein designated GAM RNA, and which when bound by GAM1141 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1141 target proteins.

[15851] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1141 gene, herein designated GAM GENE, on one or more GAM1141 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15852] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1141 correlate with, and may be deduced from, the identity of the target genes which GAM1141 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15853] Nucleotide sequences of the GAM1141 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1141 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1141 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1141 are further described hereinbelow with reference to Table 1.

[15854] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1141 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15855] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1142 (GAM1142) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15856] GAM1142 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1142 was detected is described hereinabove with reference to Figs. 2-8.

[15857] GAM1142 gene, herein designated GAM GENE, and GAM1142 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15858] GAM1142 gene, herein designated GAM GENE, encodes a GAM1142 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1142 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1142 precursor RNA is designated SEQ ID:1119, and is provided hereinbelow with reference to the sequence listing part.

[15859] GAM1142 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15860] An enzyme complex designated DICER COMPLEX, dices the GAM1142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1142 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1142 RNA is designated SEQ ID:3721, and is provided hereinbelow with reference to the sequence listing part.

[15861] GAM1142 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1142 target RNA, herein designated GAM TARGET RNA. GAM1142 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15862] GAM1142 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1142 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1142 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1142 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1142 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15863] The complementary binding of GAM1142 RNA, herein designated GAM RNA, to target binding sites on GAM1142 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1142 target RNA, herein designated GAM TARGET RNA, into GAM1142 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15864] It is appreciated that GAM1142 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1142 target genes. The mRNA of each one of this plurality of GAM1142 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1142 RNA, herein designated GAM RNA, and which when bound by GAM1142 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1142 target proteins.

[15865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1142 gene, herein designated GAM GENE, on one or more GAM1142 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15866] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1142 correlate with, and may be deduced from, the identity of the target genes which GAM1142 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15867] Nucleotide sequences of the GAM1142 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1142 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1142 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1142 are further described hereinbelow with reference to Table 1.

[15868] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1142 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15869] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1143 (GAM1143) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15870] GAM1143 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1143 was detected is described hereinabove with reference to Figs. 2-8.

[15871] GAM1143 gene, herein designated GAM GENE, and GAM1143 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15872] GAM1143 gene, herein designated GAM GENE, encodes a GAM1143 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1143 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1143 precursor RNA is designated SEQ ID:1120, and is provided hereinbelow with reference to the sequence listing part.

[15873] GAM1143 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15874] An enzyme complex designated DICER COMPLEX, dices the GAM1143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1143 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1143 RNA is designated SEQ ID:3722, and is provided hereinbelow with reference to the sequence listing part.

[15875] GAM1143 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1143 target RNA, herein designated GAM TARGET RNA. GAM1143 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15876] GAM1143 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1143 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1143 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1143 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1143 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15877] The complementary binding of GAM1143 RNA, herein designated GAM RNA, to target binding sites on GAM1143 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1143 target RNA, herein designated GAM TARGET RNA, into GAM1143 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15878] It is appreciated that GAM1143 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1143 target genes. The

mRNA of each one of this plurality of GAM1143 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1143 RNA, herein designated GAM RNA, and which when bound by GAM1143 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1143 target proteins.

[15879] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1143 gene, herein designated GAM GENE, on one or more GAM1143 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15880] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1143 correlate with, and may be deduced from, the identity of the target genes which GAM1143 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15881] Nucleotide sequences of the GAM1143 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1143 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1143 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1143 are further described hereinbelow with reference to Table 1.

[15882] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1143 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15883] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1144 (GAM1144) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15884] GAM1144 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1144 was detected is described hereinabove with reference to Figs. 2-8.

[15885] GAM1144 gene, herein designated GAM GENE, and GAM1144 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15886] GAM1144 gene, herein designated GAM GENE, encodes a GAM1144 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1144 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1144 precursor RNA is designated SEQ ID:1121, and is provided hereinbelow with reference to the sequence listing part.

[15887] GAM1144 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15888] An enzyme complex designated DICER COMPLEX, dices the GAM1144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1144 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1144 RNA is designated SEQ ID:3723, and is provided hereinbelow with reference to the sequence listing part.

[15889] GAM1144 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1144 target RNA, herein designated GAM TARGET RNA. GAM1144 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15890] GAM1144 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1144 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1144 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1144 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1144 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15891] The complementary binding of GAM1144 RNA, herein designated GAM RNA, to target binding sites on GAM1144 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1144 target RNA, herein designated GAM TARGET RNA, into GAM1144 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15892] It is appreciated that GAM1144 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1144 target genes. The mRNA of each one of this plurality of GAM1144 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1144 RNA, herein designated GAM RNA, and which when bound by GAM1144 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1144 target proteins.

[15893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1144 gene, herein designated GAM GENE, on one or more GAM1144 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15894] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1144 correlate with, and may be deduced from, the identity of the target

genes which GAM1144 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15895] Nucleotide sequences of the GAM1144 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1144 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1144 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1144 are further described hereinbelow with reference to Table 1.

[15896] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1144 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15897] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1145 (GAM1145) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15898] GAM1145 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1145 was detected is described hereinabove with reference to Figs. 2-8.

[15899] GAM1145 gene, herein designated GAM GENE, and GAM1145 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15900] GAM1145 gene, herein designated GAM GENE, encodes a GAM1145 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1145 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1145 precursor RNA is designated SEQ ID:1122, and is provided hereinbelow with reference to the sequence listing part.

[15901] GAM1145 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15902] An enzyme complex designated DICER COMPLEX, dices the GAM1145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1145 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1145 RNA is designated SEQ ID:3724, and is provided

hereinbelow with reference to the sequence listing part.

[15903] GAM1145 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1145 target RNA, herein designated GAM TARGET RNA. GAM1145 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15904] GAM1145 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1145 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1145 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1145 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1145 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15905] The complementary binding of GAM1145 RNA, herein designated GAM RNA, to target binding sites on GAM1145 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1145 target RNA, herein designated GAM TARGET RNA, into GAM1145 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15906] It is appreciated that GAM1145 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1145 target genes. The mRNA of each one of this plurality of GAM1145 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1145 RNA, herein designated GAM RNA, and which when bound by GAM1145 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1145 target proteins.

[15907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1145 gene, herein designated GAM GENE, on one or more GAM1145 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15908] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1145 correlate with, and may be deduced from, the identity of the target genes which GAM1145 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15909] Nucleotide sequences of the GAM1145 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1145 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1145 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1145 are further described hereinbelow with reference to Table 1.

[15910] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1145 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15911] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1146 (GAM1146) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15912] GAM1146 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1146 was detected is described hereinabove with reference to Figs. 2-8.

[15913] GAM1146 gene, herein designated GAM GENE, and GAM1146 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15914] GAM1146 gene, herein designated GAM GENE, encodes a GAM1146 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1146 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1146 precursor RNA is designated SEQ ID:1123, and is provided hereinbelow with reference to the sequence listing part.

[15915] GAM1146 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15916] An enzyme complex designated DICER COMPLEX, dices the GAM1146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1146 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1146 RNA is designated SEQ ID:3725, and is provided hereinbelow with reference to the sequence listing part.

[15917] GAM1146 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1146 target RNA, herein designated GAM TARGET RNA. GAM1146 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15918] GAM1146 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1146 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1146 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1146 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1146 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15919] The complementary binding of GAM1146 RNA, herein designated GAM RNA, to target binding sites on GAM1146 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1146 target RNA, herein designated GAM TARGET RNA, into GAM1146 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15920] It is appreciated that GAM1146 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1146 target genes. The mRNA of each one of this plurality of GAM1146 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1146 RNA, herein designated GAM RNA, and which when bound by GAM1146 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1146 target proteins.

[15921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1146 gene, herein designated GAM GENE, on one or more GAM1146 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15922] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1146 correlate with, and may be deduced from, the identity of the target genes which GAM1146 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15923] Nucleotide sequences of the GAM1146 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1146 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1146 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1146 are further described hereinbelow with reference to Table 1.

[15924] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1146 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15925] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1147 (GAM1147) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15926] GAM1147 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1147 was detected is described hereinabove with reference to Figs. 2-8.

[15927] GAM1147 gene, herein designated GAM GENE, and GAM1147 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15928] GAM1147 gene, herein designated GAM GENE, encodes a GAM1147 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1147 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1147 precursor RNA is designated SEQ ID:1124, and is provided hereinbelow with reference to the sequence listing part.

[15929] GAM1147 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15930] An enzyme complex designated DICER COMPLEX, dices the GAM1147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1147 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1147 RNA is designated SEQ ID:3726, and is provided hereinbelow with reference to the sequence listing part.

[15931] GAM1147 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1147 target RNA, herein designated GAM TARGET RNA. GAM1147 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15932] GAM1147 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1147 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1147 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1147 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1147 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15933] The complementary binding of GAM1147 RNA, herein designated GAM RNA, to target binding sites on GAM1147 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1147 target RNA, herein designated GAM TARGET RNA, into GAM1147 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15934] It is appreciated that GAM1147 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1147 target genes. The mRNA of each one of this plurality of GAM1147 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1147 RNA, herein designated GAM RNA, and which when bound by GAM1147 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1147 target proteins.

[15935] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1147 gene, herein designated GAM GENE, on one or more GAM1147 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15936] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1147 correlate with, and may be deduced from, the identity of the target genes which GAM1147 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15937] Nucleotide sequences of the GAM1147 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1147 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1147 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1147 are further described hereinbelow with reference to Table 1.

[15938] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1147 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[15939] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1148 (GAM1148) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15940] GAM1148 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1148 was detected is described hereinabove with reference to Figs. 2-8.

[15941] GAM1148 gene, herein designated GAM GENE, and GAM1148 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15942] GAM1148 gene, herein designated GAM GENE, encodes a GAM1148 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1148 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1148 precursor RNA is designated SEQ ID:1125, and is provided hereinbelow with reference to the sequence listing part.

[15943] GAM1148 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15944] An enzyme complex designated DICER COMPLEX, dices the GAM1148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1148 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1148 RNA is designated SEQ ID:3727, and is provided hereinbelow with reference to the sequence listing part.

[15945] GAM1148 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1148 target RNA, herein designated GAM TARGET RNA. GAM1148 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15946] GAM1148 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1148 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1148 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1148 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1148 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15947] The complementary binding of GAM1148 RNA, herein designated GAM RNA, to target binding sites on GAM1148 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1148 target RNA, herein designated GAM TARGET RNA, into GAM1148 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15948] It is appreciated that GAM1148 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1148 target genes. The mRNA of each one of this plurality of GAM1148 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1148 RNA, herein designated GAM RNA, and which when bound by GAM1148 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1148 target proteins.

[15949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1148 gene, herein designated GAM GENE, on one or more GAM1148 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15950] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1148 correlate with, and may be deduced from, the identity of the target genes which GAM1148 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15951] Nucleotide sequences of the GAM1148 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1148 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1148 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1148 are further described hereinbelow with reference to Table 1.

[15952] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1148 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15953] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1149 (GAM1149) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15954] GAM1149 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1149 was detected is described hereinabove with reference to Figs. 2-8.

[15955] GAM1149 gene, herein designated GAM GENE, and GAM1149 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15956] GAM1149 gene, herein designated GAM GENE, encodes a GAM1149 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1149 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1149 precursor RNA is designated SEQ ID:1126, and is provided hereinbelow with reference to the sequence listing part.

[15957] GAM1149 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15958] An enzyme complex designated DICER COMPLEX, dices the GAM1149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1149 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1149 RNA is designated SEQ ID:3728, and is provided hereinbelow with reference to the sequence listing part.

[15959] GAM1149 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1149 target RNA, herein designated GAM TARGET RNA. GAM1149 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15960] GAM1149 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1149 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1149 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1149 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1149 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15961] The complementary binding of GAM1149 RNA, herein designated GAM RNA, to target binding sites on GAM1149 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1149 target RNA, herein designated GAM TARGET RNA, into GAM1149 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15962] It is appreciated that GAM1149 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1149 target genes. The

mRNA of each one of this plurality of GAM1149 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1149 RNA, herein designated GAM RNA, and which when bound by GAM1149 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1149 target proteins.

[15963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1149 gene, herein designated GAM GENE, on one or more GAM1149 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15964] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1149 correlate with, and may be deduced from, the identity of the target genes which GAM1149 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15965] Nucleotide sequences of the GAM1149 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1149 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1149 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1149 are further described hereinbelow with reference to Table 1.

[15966] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1149 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15967] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1150 (GAM1150) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15968] GAM1150 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1150 was detected is described hereinabove with reference to Figs. 2-8.

[15969] GAM1150 gene, herein designated GAM GENE, and GAM1150 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15970] GAM1150 gene, herein designated GAM GENE, encodes a GAM1150 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1150 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1150 precursor RNA is designated SEQ ID:1127, and is provided hereinbelow with reference to the sequence listing part.

[15971] GAM1150 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15972] An enzyme complex designated DICER COMPLEX, dices the GAM1150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1150 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1150 RNA is designated SEQ ID:3729, and is provided hereinbelow with reference to the sequence listing part.

[15973] GAM1150 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1150 target RNA, herein designated GAM TARGET RNA. GAM1150 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15974] GAM1150 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1150 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1150 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1150 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1150 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15975] The complementary binding of GAM1150 RNA, herein designated GAM RNA, to target binding sites on GAM1150 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1150 target RNA, herein designated GAM TARGET RNA, into GAM1150 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15976] It is appreciated that GAM1150 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1150 target genes. The mRNA of each one of this plurality of GAM1150 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1150 RNA, herein designated GAM RNA, and which when bound by GAM1150 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1150 target proteins.

[15977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1150 gene, herein designated GAM GENE, on one or more GAM1150 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15978] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1150 correlate with, and may be deduced from, the identity of the target

genes which GAM1150 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15979] Nucleotide sequences of the GAM1150 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1150 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1150 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1150 are further described hereinbelow with reference to Table 1.

[15980] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1150 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15981] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1151 (GAM1151) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15982] GAM1151 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1151 was detected is described hereinabove with reference to Figs. 2-8.

[15983] GAM1151 gene, herein designated GAM GENE, and GAM1151 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[15984] GAM1151 gene, herein designated GAM GENE, encodes a GAM1151 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1151 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1151 precursor RNA is designated SEQ ID:1128, and is provided hereinbelow with reference to the sequence listing part.

[15985] GAM1151 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15986] An enzyme complex designated DICER COMPLEX, dices the GAM1151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1151 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1151 RNA is designated SEQ ID:3730, and is provided

hereinbelow with reference to the sequence listing part.

[15987] GAM1151 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1151 target RNA, herein designated GAM TARGET RNA. GAM1151 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15988] GAM1151 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1151 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1151 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1151 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1151 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15989] The complementary binding of GAM1151 RNA, herein designated GAM RNA, to target binding sites on GAM1151 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1151 target RNA, herein designated GAM TARGET RNA, into GAM1151 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[15990] It is appreciated that GAM1151 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1151 target genes. The mRNA of each one of this plurality of GAM1151 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1151 RNA, herein designated GAM RNA, and which when bound by GAM1151 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1151 target proteins.

[15991] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1151 gene, herein designated GAM GENE, on one or more GAM1151 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15992] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1151 correlate with, and may be deduced from, the identity of the target genes which GAM1151 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15993] Nucleotide sequences of the GAM1151 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1151 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1151 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1151 are further described hereinbelow with reference to Table 1.

[15994] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1151 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[15995] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1152 (GAM1152) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[15996] GAM1152 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1152 was detected is described hereinabove with reference to Figs. 2-8.

[15997] GAM1152 gene, herein designated GAM GENE, and GAM1152 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[15998] GAM1152 gene, herein designated GAM GENE, encodes a GAM1152 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1152 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1152 precursor RNA is designated SEQ ID:1129, and is provided hereinbelow with reference to the sequence listing part.

[15999] GAM1152 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16000] An enzyme complex designated DICER COMPLEX, dices the GAM1152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1152 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1152 RNA is designated SEQ ID:3731, and is provided hereinbelow with reference to the sequence listing part.

[16001] GAM1152 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1152 target RNA, herein designated GAM TARGET RNA. GAM1152 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16002] GAM1152 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1152 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1152 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1152 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1152 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16003] The complementary binding of GAM1152 RNA, herein designated GAM RNA, to target binding sites on GAM1152 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1152 target RNA, herein designated GAM TARGET RNA, into GAM1152 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16004] It is appreciated that GAM1152 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1152 target genes. The mRNA of each one of this plurality of GAM1152 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1152 RNA, herein designated GAM RNA, and which when bound by GAM1152 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1152 target proteins.

[16005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1152 gene, herein designated GAM GENE, on one or more GAM1152 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16006] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1152 correlate with, and may be deduced from, the identity of the target genes which GAM1152 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16007] Nucleotide sequences of the GAM1152 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1152 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1152 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1152 are further described hereinbelow with reference to Table 1.

[16008] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1152 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16009] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1153 (GAM1153) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16010] GAM1153 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1153 was detected is described hereinabove with reference to Figs. 2-8.

[16011] GAM1153 gene, herein designated GAM GENE, and GAM1153 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16012] GAM1153 gene, herein designated GAM GENE, encodes a GAM1153 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1153 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1153 precursor RNA is designated SEQ ID:1130, and is provided hereinbelow with reference to the sequence listing part.

[16013] GAM1153 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16014] An enzyme complex designated DICER COMPLEX, dices the GAM1153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1153 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1153 RNA is designated SEQ ID:3732, and is provided hereinbelow with reference to the sequence listing part.

[16015] GAM1153 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1153 target RNA, herein designated GAM TARGET RNA. GAM1153 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16016] GAM1153 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1153 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1153 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1153 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1153 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16017] The complementary binding of GAM1153 RNA, herein designated GAM RNA, to target binding sites on GAM1153 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1153 target RNA, herein designated GAM TARGET RNA, into GAM1153 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16018] It is appreciated that GAM1153 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1153 target genes. The mRNA of each one of this plurality of GAM1153 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1153 RNA, herein designated GAM RNA, and which when bound by GAM1153 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1153 target proteins.

[16019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1153 gene, herein designated GAM GENE, on one or more GAM1153 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16020] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1153 correlate with, and may be deduced from, the identity of the target genes which GAM1153 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16021] Nucleotide sequences of the GAM1153 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1153 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1153 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1153 are further described hereinbelow with reference to Table 1.

[16022] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1153 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16023] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1154 (GAM1154) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16024] GAM1154 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1154 was detected is described hereinabove with reference to Figs. 2-8.

[16025] GAM1154 gene, herein designated GAM GENE, and GAM1154 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16026] GAM1154 gene, herein designated GAM GENE, encodes a GAM1154 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1154 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1154 precursor RNA is designated SEQ ID:1131, and is provided hereinbelow with reference to the sequence listing part.

[16027] GAM1154 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16028] An enzyme complex designated DICER COMPLEX, dices the GAM1154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1154 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1154 RNA is designated SEQ ID:3733, and is provided hereinbelow with reference to the sequence listing part.

[16029] GAM1154 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1154 target RNA, herein designated GAM TARGET RNA. GAM1154 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16030] GAM1154 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1154 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1154 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1154 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1154 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16031] The complementary binding of GAM1154 RNA, herein designated GAM RNA, to target binding sites on GAM1154 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1154 target RNA, herein designated GAM TARGET RNA, into GAM1154 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16032] It is appreciated that GAM1154 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1154 target genes. The mRNA of each one of this plurality of GAM1154 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1154 RNA, herein designated GAM RNA, and which when bound by GAM1154 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1154 target proteins.

[16033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1154 gene, herein designated GAM GENE, on one or more GAM1154 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16034] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1154 correlate with, and may be deduced from, the identity of the target genes which GAM1154 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16035] Nucleotide sequences of the GAM1154 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1154 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1154 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1154 are further described hereinbelow with reference to Table 1.

[16036] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1154 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16037] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1155 (GAM1155) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16038] GAM1155 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1155 was detected is described hereinabove with reference to Figs. 2-8.

[16039] GAM1155 gene, herein designated GAM GENE, and GAM1155 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16040] GAM1155 gene, herein designated GAM GENE, encodes a GAM1155 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1155 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1155 precursor RNA is designated SEQ ID:1132, and is provided hereinbelow with reference to the sequence listing part.

[16041] GAM1155 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16042] An enzyme complex designated DICER COMPLEX, dices the GAM1155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1155 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1155 RNA is designated SEQ ID:3734, and is provided hereinbelow with reference to the sequence listing part.

[16043] GAM1155 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1155 target RNA, herein designated GAM TARGET RNA. GAM1155 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16044] GAM1155 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1155 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1155 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1155 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1155 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16045] The complementary binding of GAM1155 RNA, herein designated GAM RNA, to target binding sites on GAM1155 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1155 target RNA, herein designated GAM TARGET RNA, into GAM1155 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16046] It is appreciated that GAM1155 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1155 target genes. The

mRNA of each one of this plurality of GAM1155 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1155 RNA, herein designated GAM RNA, and which when bound by GAM1155 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1155 target proteins.

[16047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1155 gene, herein designated GAM GENE, on one or more GAM1155 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16048] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1155 correlate with, and may be deduced from, the identity of the target genes which GAM1155 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16049] Nucleotide sequences of the GAM1155 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1155 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1155 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1155 are further described hereinbelow with reference to Table 1.

[16050] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1155 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16051] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1156 (GAM1156) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16052] GAM1156 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1156 was detected is described hereinabove with reference to Figs. 2-8.

[16053] GAM1156 gene, herein designated GAM GENE, and GAM1156 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16054] GAM1156 gene, herein designated GAM GENE, encodes a GAM1156 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1156 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1156 precursor RNA is designated SEQ ID:1133, and is provided hereinbelow with reference to the sequence listing part.

[16055] GAM1156 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16056] An enzyme complex designated DICER COMPLEX, dices the GAM1156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1156 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1156 RNA is designated SEQ ID:3736, and is provided hereinbelow with reference to the sequence listing part.

[16057] GAM1156 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1156 target RNA, herein designated GAM TARGET RNA. GAM1156 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16058] GAM1156 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1156 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1156 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1156 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1156 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16059] The complementary binding of GAM1156 RNA, herein designated GAM RNA, to target binding sites on GAM1156 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1156 target RNA, herein designated GAM TARGET RNA, into GAM1156 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16060] It is appreciated that GAM1156 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1156 target genes. The mRNA of each one of this plurality of GAM1156 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1156 RNA, herein designated GAM RNA, and which when bound by GAM1156 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1156 target proteins.

[16061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1156 gene, herein designated GAM GENE, on one or more GAM1156 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16062] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1156 correlate with, and may be deduced from, the identity of the target

genes which GAM1156 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16063] Nucleotide sequences of the GAM1156 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1156 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1156 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1156 are further described hereinbelow with reference to Table 1.

[16064] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1156 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16065] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1157 (GAM1157) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16066] GAM1157 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1157 was detected is described hereinabove with reference to Figs. 2-8.

[16067] GAM1157 gene, herein designated GAM GENE, and GAM1157 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16068] GAM1157 gene, herein designated GAM GENE, encodes a GAM1157 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1157 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1157 precursor RNA is designated SEQ ID:1134, and is provided hereinbelow with reference to the sequence listing part.

[16069] GAM1157 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16070] An enzyme complex designated DICER COMPLEX, dices the GAM1157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1157 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1157 RNA is designated SEQ ID:3735, and is provided

hereinbelow with reference to the sequence listing part.

[16071] GAM1157 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1157 target RNA, herein designated GAM TARGET RNA. GAM1157 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16072] GAM1157 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1157 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1157 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1157 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1157 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16073] The complementary binding of GAM1157 RNA, herein designated GAM RNA, to target binding sites on GAM1157 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1157 target RNA, herein designated GAM TARGET RNA, into GAM1157 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16074] It is appreciated that GAM1157 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1157 target genes. The mRNA of each one of this plurality of GAM1157 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1157 RNA, herein designated GAM RNA, and which when bound by GAM1157 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1157 target proteins.

[16075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1157 gene, herein designated GAM GENE, on one or more GAM1157 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16076] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1157 correlate with, and may be deduced from, the identity of the target genes which GAM1157 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16077] Nucleotide sequences of the GAM1157 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1157 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1157 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1157 are further described hereinbelow with reference to Table 1.

[16078] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1157 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16079] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1158 (GAM1158) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16080] GAM1158 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1158 was detected is described hereinabove with reference to Figs. 2-8.

[16081] GAM1158 gene, herein designated GAM GENE, and GAM1158 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16082] GAM1158 gene, herein designated GAM GENE, encodes a GAM1158 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1158 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1158 precursor RNA is designated SEQ ID:1135, and is provided hereinbelow with reference to the sequence listing part.

[16083] GAM1158 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16084] An enzyme complex designated DICER COMPLEX, dices the GAM1158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1158 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1158 RNA is designated SEQ ID:3737, and is provided hereinbelow with reference to the sequence listing part.

[16085] GAM1158 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1158 target RNA, herein designated GAM TARGET RNA. GAM1158 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16086] GAM1158 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1158 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1158 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1158 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1158 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16087] The complementary binding of GAM1158 RNA, herein designated GAM RNA, to target binding sites on GAM1158 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1158 target RNA, herein designated GAM TARGET RNA, into GAM1158 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16088] It is appreciated that GAM1158 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1158 target genes. The mRNA of each one of this plurality of GAM1158 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1158 RNA, herein designated GAM RNA, and which when bound by GAM1158 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1158 target proteins.

[16089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1158 gene, herein designated GAM GENE, on one or more GAM1158 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16090] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1158 correlate with, and may be deduced from, the identity of the target genes which GAM1158 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16091] Nucleotide sequences of the GAM1158 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1158 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1158 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1158 are further described hereinbelow with reference to Table 1.

[16092] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1158 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16093] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1159 (GAM1159) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16094] GAM1159 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1159 was detected is described hereinabove with reference to Figs. 2-8.

[16095] GAM1159 gene, herein designated GAM GENE, and GAM1159 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16096] GAM1159 gene, herein designated GAM GENE, encodes a GAM1159 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1159 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1159 precursor RNA is designated SEQ ID:1136, and is provided hereinbelow with reference to the sequence listing part.

[16097] GAM1159 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16098] An enzyme complex designated DICER COMPLEX, dices the GAM1159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1159 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1159 RNA is designated SEQ ID:3738, and is provided hereinbelow with reference to the sequence listing part.

[16099] GAM1159 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1159 target RNA, herein designated GAM TARGET RNA. GAM1159 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16100] GAM1159 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1159 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1159 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1159 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1159 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16101] The complementary binding of GAM1159 RNA, herein designated GAM RNA, to target binding sites on GAM1159 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1159 target RNA, herein designated GAM TARGET RNA, into GAM1159 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16102] It is appreciated that GAM1159 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1159 target genes. The mRNA of each one of this plurality of GAM1159 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1159 RNA, herein designated GAM RNA, and which when bound by GAM1159 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1159 target proteins.

[16103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1159 gene, herein designated GAM GENE, on one or more GAM1159 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16104] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1159 correlate with, and may be deduced from, the identity of the target genes which GAM1159 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16105] Nucleotide sequences of the GAM1159 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1159 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1159 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1159 are further described hereinbelow with reference to Table 1.

[16106] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1159 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16107] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1160 (GAM1160) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16108] GAM1160 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1160 was detected is described hereinabove with reference to Figs. 2-8.

[16109] GAM1160 gene, herein designated GAM GENE, and GAM1160 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16110] GAM1160 gene, herein designated GAM GENE, encodes a GAM1160 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1160 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1160 precursor RNA is designated SEQ ID:1137, and is provided hereinbelow with reference to the sequence listing part.

[16111] GAM1160 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16112] An enzyme complex designated DICER COMPLEX, dices the GAM1160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1160 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1160 RNA is designated SEQ ID:3739, and is provided hereinbelow with reference to the sequence listing part.

[16113] GAM1160 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1160 target RNA, herein designated GAM TARGET RNA. GAM1160 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16114] GAM1160 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1160 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1160 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1160 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1160 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16115] The complementary binding of GAM1160 RNA, herein designated GAM RNA, to target binding sites on GAM1160 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1160 target RNA, herein designated GAM TARGET RNA, into GAM1160 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16116] It is appreciated that GAM1160 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1160 target genes. The mRNA of each one of this plurality of GAM1160 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1160 RNA, herein designated GAM RNA, and which when bound by GAM1160 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1160 target proteins.

[16117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1160 gene, herein designated GAM GENE, on one or more GAM1160 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16118] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1160 correlate with, and may be deduced from, the identity of the target genes which GAM1160 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16119] Nucleotide sequences of the GAM1160 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1160 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1160 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1160 are further described hereinbelow with reference to Table 1.

[16120] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1160 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16121] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1161 (GAM1161) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16122] GAM1161 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1161 was detected is described hereinabove with reference to Figs. 2-8.

[16123] GAM1161 gene, herein designated GAM GENE, and GAM1161 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16124] GAM1161 gene, herein designated GAM GENE, encodes a GAM1161 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1161 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1161 precursor RNA is designated SEQ ID:1138, and is provided hereinbelow with reference to the sequence listing part.

[16125] GAM1161 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16126] An enzyme complex designated DICER COMPLEX, dices the GAM1161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1161 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1161 RNA is designated SEQ ID:3740, and is provided hereinbelow with reference to the sequence listing part.

[16127] GAM1161 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1161 target RNA, herein designated GAM TARGET RNA. GAM1161 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16128] GAM1161 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1161 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1161 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1161 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1161 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16129] The complementary binding of GAM1161 RNA, herein designated GAM RNA, to target binding sites on GAM1161 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1161 target RNA, herein designated GAM TARGET RNA, into GAM1161 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16130] It is appreciated that GAM1161 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1161 target genes. The

mRNA of each one of this plurality of GAM1161 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1161 RNA, herein designated GAM RNA, and which when bound by GAM1161 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1161 target proteins.

[16131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1161 gene, herein designated GAM GENE, on one or more GAM1161 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16132] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1161 correlate with, and may be deduced from, the identity of the target genes which GAM1161 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16133] Nucleotide sequences of the GAM1161 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1161 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1161 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1161 are further described hereinbelow with reference to Table 1.

[16134] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1161 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16135] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1162 (GAM1162) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16136] GAM1162 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1162 was detected is described hereinabove with reference to Figs. 2-8.

[16137] GAM1162 gene, herein designated GAM GENE, and GAM1162 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16138] GAM1162 gene, herein designated GAM GENE, encodes a GAM1162 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1162 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1162 precursor RNA is designated SEQ ID:1139, and is provided hereinbelow with reference to the sequence listing part.

[16139] GAM1162 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16140] An enzyme complex designated DICER COMPLEX, dices the GAM1162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1162 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1162 RNA is designated SEQ ID:3742, and is provided hereinbelow with reference to the sequence listing part.

[16141] GAM1162 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1162 target RNA, herein designated GAM TARGET RNA. GAM1162 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16142] GAM1162 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1162 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1162 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1162 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1162 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16143] The complementary binding of GAM1162 RNA, herein designated GAM RNA, to target binding sites on GAM1162 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1162 target RNA, herein designated GAM TARGET RNA, into GAM1162 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16144] It is appreciated that GAM1162 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1162 target genes. The mRNA of each one of this plurality of GAM1162 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1162 RNA, herein designated GAM RNA, and which when bound by GAM1162 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1162 target proteins.

[16145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1162 gene, herein designated GAM GENE, on one or more GAM1162 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16146] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1162 correlate with, and may be deduced from, the identity of the target

genes which GAM1162 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16147] Nucleotide sequences of the GAM1162 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1162 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1162 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1162 are further described hereinbelow with reference to Table 1.

[16148] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1162 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16149] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1163 (GAM1163) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16150] GAM1163 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1163 was detected is described hereinabove with reference to Figs. 2-8.

[16151] GAM1163 gene, herein designated GAM GENE, and GAM1163 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16152] GAM1163 gene, herein designated GAM GENE, encodes a GAM1163 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1163 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1163 precursor RNA is designated SEQ ID:1140, and is provided hereinbelow with reference to the sequence listing part.

[16153] GAM1163 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16154] An enzyme complex designated DICER COMPLEX, dices the GAM1163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1163 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1163 RNA is designated SEQ ID:3741, and is provided

hereinbelow with reference to the sequence listing part.

[16155] GAM1163 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1163 target RNA, herein designated GAM TARGET RNA. GAM1163 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16156] GAM1163 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1163 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1163 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1163 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1163 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16157] The complementary binding of GAM1163 RNA, herein designated GAM RNA, to target binding sites on GAM1163 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1163 target RNA, herein designated GAM TARGET RNA, into GAM1163 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16158] It is appreciated that GAM1163 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1163 target genes. The mRNA of each one of this plurality of GAM1163 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1163 RNA, herein designated GAM RNA, and which when bound by GAM1163 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1163 target proteins.

[16159] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1163 gene, herein designated GAM GENE, on one or more GAM1163 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16160] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1163 correlate with, and may be deduced from, the identity of the target genes which GAM1163 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16161] Nucleotide sequences of the GAM1163 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1163 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1163 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1163 are further described hereinbelow with reference to Table 1.

[16162] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1163 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16163] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1164 (GAM1164) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16164] GAM1164 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1164 was detected is described hereinabove with reference to Figs. 2-8.

[16165] GAM1164 gene, herein designated GAM GENE, and GAM1164 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16166] GAM1164 gene, herein designated GAM GENE, encodes a GAM1164 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1164 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1164 precursor RNA is designated SEQ ID:1141, and is provided hereinbelow with reference to the sequence listing part.

[16167] GAM1164 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16168] An enzyme complex designated DICER COMPLEX, dices the GAM1164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1164 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1164 RNA is designated SEQ ID:3743, and is provided hereinbelow with reference to the sequence listing part.

[16169] GAM1164 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1164 target RNA, herein designated GAM TARGET RNA. GAM1164 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16170] GAM1164 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1164 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1164 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1164 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1164 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16171] The complementary binding of GAM1164 RNA, herein designated GAM RNA, to target binding sites on GAM1164 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1164 target RNA, herein designated GAM TARGET RNA, into GAM1164 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16172] It is appreciated that GAM1164 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1164 target genes. The mRNA of each one of this plurality of GAM1164 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1164 RNA, herein designated GAM RNA, and which when bound by GAM1164 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1164 target proteins.

[16173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1164 gene, herein designated GAM GENE, on one or more GAM1164 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16174] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1164 correlate with, and may be deduced from, the identity of the target genes which GAM1164 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16175] Nucleotide sequences of the GAM1164 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1164 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1164 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1164 are further described hereinbelow with reference to Table 1.

[16176] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1164 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16177] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1165 (GAM1165) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16178] GAM1165 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1165 was detected is described hereinabove with reference to Figs. 2-8.

[16179] GAM1165 gene, herein designated GAM GENE, and GAM1165 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16180] GAM1165 gene, herein designated GAM GENE, encodes a GAM1165 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1165 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1165 precursor RNA is designated SEQ ID:1142, and is provided hereinbelow with reference to the sequence listing part.

[16181] GAM1165 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16182] An enzyme complex designated DICER COMPLEX, dices the GAM1165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1165 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1165 RNA is designated SEQ ID:3744, and is provided hereinbelow with reference to the sequence listing part.

[16183] GAM1165 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1165 target RNA, herein designated GAM TARGET RNA. GAM1165 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16184] GAM1165 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1165 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1165 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1165 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1165 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16185] The complementary binding of GAM1165 RNA, herein designated GAM RNA, to target binding sites on GAM1165 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1165 target RNA, herein designated GAM TARGET RNA, into GAM1165 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16186] It is appreciated that GAM1165 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1165 target genes. The mRNA of each one of this plurality of GAM1165 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1165 RNA, herein designated GAM RNA, and which when bound by GAM1165 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1165 target proteins.

[16187] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1165 gene, herein designated GAM GENE, on one or more GAM1165 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16188] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1165 correlate with, and may be deduced from, the identity of the target genes which GAM1165 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16189] Nucleotide sequences of the GAM1165 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1165 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1165 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1165 are further described hereinbelow with reference to Table 1.

[16190] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1165 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16191] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1166 (GAM1166) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16192] GAM1166 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1166 was detected is described hereinabove with reference to Figs. 2-8.

[16193] GAM1166 gene, herein designated GAM GENE, and GAM1166 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16194] GAM1166 gene, herein designated GAM GENE, encodes a GAM1166 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1166 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1166 precursor RNA is designated SEQ ID:1143, and is provided hereinbelow with reference to the sequence listing part.

[16195] GAM1166 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16196] An enzyme complex designated DICER COMPLEX, dices the GAM1166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1166 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1166 RNA is designated SEQ ID:3745, and is provided hereinbelow with reference to the sequence listing part.

[16197] GAM1166 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1166 target RNA, herein designated GAM TARGET RNA. GAM1166 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16198] GAM1166 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1166 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1166 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1166 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1166 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16199] The complementary binding of GAM1166 RNA, herein designated GAM RNA, to target binding sites on GAM1166 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1166 target RNA, herein designated GAM TARGET RNA, into GAM1166 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16200] It is appreciated that GAM1166 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1166 target genes. The mRNA of each one of this plurality of GAM1166 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1166 RNA, herein designated GAM RNA, and which when bound by GAM1166 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1166 target proteins.

[16201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1166 gene, herein designated GAM GENE, on one or more GAM1166 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16202] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1166 correlate with, and may be deduced from, the identity of the target genes which GAM1166 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16203] Nucleotide sequences of the GAM1166 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1166 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1166 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1166 are further described hereinbelow with reference to Table 1.

[16204] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1166 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16205] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1167 (GAM1167) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16206] GAM1167 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1167 was detected is described hereinabove with reference to Figs. 2-8.

[16207] GAM1167 gene, herein designated GAM GENE, and GAM1167 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16208] GAM1167 gene, herein designated GAM GENE, encodes a GAM1167 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1167 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1167 precursor RNA is designated SEQ ID:1144, and is provided hereinbelow with reference to the sequence listing part.

[16209] GAM1167 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16210] An enzyme complex designated DICER COMPLEX, dices the GAM1167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1167 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1167 RNA is designated SEQ ID:3746, and is provided hereinbelow with reference to the sequence listing part.

[16211] GAM1167 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1167 target RNA, herein designated GAM TARGET RNA. GAM1167 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16212] GAM1167 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1167 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1167 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1167 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1167 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16213] The complementary binding of GAM1167 RNA, herein designated GAM RNA, to target binding sites on GAM1167 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1167 target RNA, herein designated GAM TARGET RNA, into GAM1167 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16214] It is appreciated that GAM1167 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1167 target genes. The

mRNA of each one of this plurality of GAM1167 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1167 RNA, herein designated GAM RNA, and which when bound by GAM1167 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1167 target proteins.

[16215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1167 gene, herein designated GAM GENE, on one or more GAM1167 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16216] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1167 correlate with, and may be deduced from, the identity of the target genes which GAM1167 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16217] Nucleotide sequences of the GAM1167 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1167 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1167 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1167 are further described hereinbelow with reference to Table 1.

[16218] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1167 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16219] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1168 (GAM1168) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16220] GAM1168 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1168 was detected is described hereinabove with reference to Figs. 2-8.

[16221] GAM1168 gene, herein designated GAM GENE, and GAM1168 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16222] GAM1168 gene, herein designated GAM GENE, encodes a GAM1168 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1168 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1168 precursor RNA is designated SEQ ID:1145, and is provided hereinbelow with reference to the sequence listing part.

[16223] GAM1168 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16224] An enzyme complex designated DICER COMPLEX, dices the GAM1168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1168 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1168 RNA is designated SEQ ID:3749, and is provided hereinbelow with reference to the sequence listing part.

[16225] GAM1168 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1168 target RNA, herein designated GAM TARGET RNA. GAM1168 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16226] GAM1168 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1168 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1168 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1168 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1168 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16227] The complementary binding of GAM1168 RNA, herein designated GAM RNA, to target binding sites on GAM1168 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1168 target RNA, herein designated GAM TARGET RNA, into GAM1168 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16228] It is appreciated that GAM1168 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1168 target genes. The mRNA of each one of this plurality of GAM1168 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1168 RNA, herein designated GAM RNA, and which when bound by GAM1168 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1168 target proteins.

[16229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1168 gene, herein designated GAM GENE, on one or more GAM1168 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16230] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1168 correlate with, and may be deduced from, the identity of the target

genes which GAM1168 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16231] Nucleotide sequences of the GAM1168 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1168 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1168 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1168 are further described hereinbelow with reference to Table 1.

[16232] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1168 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16233] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1169 (GAM1169) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16234] GAM1169 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1169 was detected is described hereinabove with reference to Figs. 2-8.

[16235] GAM1169 gene, herein designated GAM GENE, and GAM1169 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16236] GAM1169 gene, herein designated GAM GENE, encodes a GAM1169 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1169 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1169 precursor RNA is designated SEQ ID:1146, and is provided hereinbelow with reference to the sequence listing part.

[16237] GAM1169 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16238] An enzyme complex designated DICER COMPLEX, dices the GAM1169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1169 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1169 RNA is designated SEQ ID:3750, and is provided

hereinbelow with reference to the sequence listing part.

[16239] GAM1169 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1169 target RNA, herein designated GAM TARGET RNA. GAM1169 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16240] GAM1169 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1169 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1169 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1169 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1169 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16241] The complementary binding of GAM1169 RNA, herein designated GAM RNA, to target binding sites on GAM1169 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1169 target RNA, herein designated GAM TARGET RNA, into GAM1169 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16242] It is appreciated that GAM1169 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1169 target genes. The mRNA of each one of this plurality of GAM1169 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1169 RNA, herein designated GAM RNA, and which when bound by GAM1169 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1169 target proteins.

[16243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1169 gene, herein designated GAM GENE, on one or more GAM1169 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16244] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1169 correlate with, and may be deduced from, the identity of the target genes which GAM1169 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16245] Nucleotide sequences of the GAM1169 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1169 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1169 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1169 are further described hereinbelow with reference to Table 1.

[16246] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1169 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16247] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1170 (GAM1170) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16248] GAM1170 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1170 was detected is described hereinabove with reference to Figs. 2-8.

[16249] GAM1170 gene, herein designated GAM GENE, and GAM1170 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16250] GAM1170 gene, herein designated GAM GENE, encodes a GAM1170 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1170 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1170 precursor RNA is designated SEQ ID:1147, and is provided hereinbelow with reference to the sequence listing part.

[16251] GAM1170 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16252] An enzyme complex designated DICER COMPLEX, dices the GAM1170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1170 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1170 RNA is designated SEQ ID:3747, and is provided hereinbelow with reference to the sequence listing part.

[16253] GAM1170 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1170 target RNA, herein designated GAM TARGET RNA. GAM1170 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16254] GAM1170 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1170 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1170 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1170 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1170 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16255] The complementary binding of GAM1170 RNA, herein designated GAM RNA, to target binding sites on GAM1170 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1170 target RNA, herein designated GAM TARGET RNA, into GAM1170 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16256] It is appreciated that GAM1170 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1170 target genes. The mRNA of each one of this plurality of GAM1170 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1170 RNA, herein designated GAM RNA, and which when bound by GAM1170 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1170 target proteins.

[16257] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1170 gene, herein designated GAM GENE, on one or more GAM1170 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16258] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1170 correlate with, and may be deduced from, the identity of the target genes which GAM1170 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16259] Nucleotide sequences of the GAM1170 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1170 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1170 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1170 are further described hereinbelow with reference to Table 1.

[16260] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1170 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16261] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1171 (GAM1171) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16262] GAM1171 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1171 was detected is described hereinabove with reference to Figs. 2-8.

[16263] GAM1171 gene, herein designated GAM GENE, and GAM1171 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16264] GAM1171 gene, herein designated GAM GENE, encodes a GAM1171 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1171 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1171 precursor RNA is designated SEQ ID:1148, and is provided hereinbelow with reference to the sequence listing part.

[16265] GAM1171 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16266] An enzyme complex designated DICER COMPLEX, dices the GAM1171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1171 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1171 RNA is designated SEQ ID:3748, and is provided hereinbelow with reference to the sequence listing part.

[16267] GAM1171 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1171 target RNA, herein designated GAM TARGET RNA. GAM1171 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16268] GAM1171 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1171 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1171 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1171 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1171 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16269] The complementary binding of GAM1171 RNA, herein designated GAM RNA, to target binding sites on GAM1171 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1171 target RNA, herein designated GAM TARGET RNA, into GAM1171 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16270] It is appreciated that GAM1171 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1171 target genes. The mRNA of each one of this plurality of GAM1171 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1171 RNA, herein designated GAM RNA, and which when bound by GAM1171 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1171 target proteins.

[16271] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1171 gene, herein designated GAM GENE, on one or more GAM1171 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16272] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1171 correlate with, and may be deduced from, the identity of the target genes which GAM1171 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16273] Nucleotide sequences of the GAM1171 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1171 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1171 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1171 are further described hereinbelow with reference to Table 1.

[16274] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1171 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16275] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1172 (GAM1172) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16276] GAM1172 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1172 was detected is described hereinabove with reference to Figs. 2-8.

[16277] GAM1172 gene, herein designated GAM GENE, and GAM1172 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16278] GAM1172 gene, herein designated GAM GENE, encodes a GAM1172 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1172 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1172 precursor RNA is designated SEQ ID:1149, and is provided hereinbelow with reference to the sequence listing part.

[16279] GAM1172 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16280] An enzyme complex designated DICER COMPLEX, dices the GAM1172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1172 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1172 RNA is designated SEQ ID:3751, and is provided hereinbelow with reference to the sequence listing part.

[16281] GAM1172 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1172 target RNA, herein designated GAM TARGET RNA. GAM1172 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16282] GAM1172 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1172 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1172 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1172 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1172 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16283] The complementary binding of GAM1172 RNA, herein designated GAM RNA, to target binding sites on GAM1172 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1172 target RNA, herein designated GAM TARGET RNA, into GAM1172 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16284] It is appreciated that GAM1172 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1172 target genes. The mRNA of each one of this plurality of GAM1172 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1172 RNA, herein designated GAM RNA, and which when bound by GAM1172 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1172 target proteins.

[16285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1172 gene, herein designated GAM GENE, on one or more GAM1172 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16286] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1172 correlate with, and may be deduced from, the identity of the target genes which GAM1172 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16287] Nucleotide sequences of the GAM1172 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1172 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1172 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1172 are further described hereinbelow with reference to Table 1.

[16288] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1172 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16289] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1173 (GAM1173) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16290] GAM1173 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1173 was detected is described hereinabove with reference to Figs. 2-8.

[16291] GAM1173 gene, herein designated GAM GENE, and GAM1173 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16292] GAM1173 gene, herein designated GAM GENE, encodes a GAM1173 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1173 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1173 precursor RNA is designated SEQ ID:1150, and is provided hereinbelow with reference to the sequence listing part.

[16293] GAM1173 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16294] An enzyme complex designated DICER COMPLEX, dices the GAM1173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1173 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1173 RNA is designated SEQ ID:3752, and is provided hereinbelow with reference to the sequence listing part.

[16295] GAM1173 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1173 target RNA, herein designated GAM TARGET RNA. GAM1173 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16296] GAM1173 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1173 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1173 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1173 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1173 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16297] The complementary binding of GAM1173 RNA, herein designated GAM RNA, to target binding sites on GAM1173 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1173 target RNA, herein designated GAM TARGET RNA, into GAM1173 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16298] It is appreciated that GAM1173 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1173 target genes. The

mRNA of each one of this plurality of GAM1173 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1173 RNA, herein designated GAM RNA, and which when bound by GAM1173 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1173 target proteins.

[16299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1173 gene, herein designated GAM GENE, on one or more GAM1173 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16300] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1173 correlate with, and may be deduced from, the identity of the target genes which GAM1173 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16301] Nucleotide sequences of the GAM1173 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1173 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1173 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1173 are further described hereinbelow with reference to Table 1.

[16302] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1173 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16303] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1174 (GAM1174) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16304] GAM1174 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1174 was detected is described hereinabove with reference to Figs. 2-8.

[16305] GAM1174 gene, herein designated GAM GENE, and GAM1174 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16306] GAM1174 gene, herein designated GAM GENE, encodes a GAM1174 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1174 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1174 precursor RNA is designated SEQ ID:1151, and is provided hereinbelow with reference to the sequence listing part.

[16307] GAM1174 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16308] An enzyme complex designated DICER COMPLEX, dices the GAM1174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1174 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1174 RNA is designated SEQ ID:3753, and is provided hereinbelow with reference to the sequence listing part.

[16309] GAM1174 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1174 target RNA, herein designated GAM TARGET RNA. GAM1174 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16310] GAM1174 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1174 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1174 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1174 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1174 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16311] The complementary binding of GAM1174 RNA, herein designated GAM RNA, to target binding sites on GAM1174 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1174 target RNA, herein designated GAM TARGET RNA, into GAM1174 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16312] It is appreciated that GAM1174 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1174 target genes. The mRNA of each one of this plurality of GAM1174 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1174 RNA, herein designated GAM RNA, and which when bound by GAM1174 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1174 target proteins.

[16313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1174 gene, herein designated GAM GENE, on one or more GAM1174 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16314] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1174 correlate with, and may be deduced from, the identity of the target

genes which GAM1174 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16315] Nucleotide sequences of the GAM1174 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1174 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1174 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1174 are further described hereinbelow with reference to Table 1.

[16316] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1174 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16317] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1175 (GAM1175) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16318] GAM1175 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1175 was detected is described hereinabove with reference to Figs. 2-8.

[16319] GAM1175 gene, herein designated GAM GENE, and GAM1175 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16320] GAM1175 gene, herein designated GAM GENE, encodes a GAM1175 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1175 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1175 precursor RNA is designated SEQ ID:1152, and is provided hereinbelow with reference to the sequence listing part.

[16321] GAM1175 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16322] An enzyme complex designated DICER COMPLEX, dices the GAM1175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1175 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1175 RNA is designated SEQ ID:3754, and is provided

hereinbelow with reference to the sequence listing part.

[16323] GAM1175 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1175 target RNA, herein designated GAM TARGET RNA. GAM1175 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16324] GAM1175 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1175 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1175 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1175 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1175 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16325] The complementary binding of GAM1175 RNA, herein designated GAM RNA, to target binding sites on GAM1175 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1175 target RNA, herein designated GAM TARGET RNA, into GAM1175 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16326] It is appreciated that GAM1175 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1175 target genes. The mRNA of each one of this plurality of GAM1175 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1175 RNA, herein designated GAM RNA, and which when bound by GAM1175 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1175 target proteins.

[16327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1175 gene, herein designated GAM GENE, on one or more GAM1175 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16328] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1175 correlate with, and may be deduced from, the identity of the target genes which GAM1175 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16329] Nucleotide sequences of the GAM1175 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1175 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1175 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1175 are further described hereinbelow with reference to Table 1.

[16330] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1175 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16331] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1176 (GAM1176) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16332] GAM1176 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1176 was detected is described hereinabove with reference to Figs. 2-8.

[16333] GAM1176 gene, herein designated GAM GENE, and GAM1176 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16334] GAM1176 gene, herein designated GAM GENE, encodes a GAM1176 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1176 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1176 precursor RNA is designated SEQ ID:1153, and is provided hereinbelow with reference to the sequence listing part.

[16335] GAM1176 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16336] An enzyme complex designated DICER COMPLEX, dices the GAM1176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1176 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1176 RNA is designated SEQ ID:3755, and is provided hereinbelow with reference to the sequence listing part.

[16337] GAM1176 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1176 target RNA, herein designated GAM TARGET RNA. GAM1176 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16338] GAM1176 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1176 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1176 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1176 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1176 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16339] The complementary binding of GAM1176 RNA, herein designated GAM RNA, to target binding sites on GAM1176 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1176 target RNA, herein designated GAM TARGET RNA, into GAM1176 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16340] It is appreciated that GAM1176 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1176 target genes. The

mRNA of each one of this plurality of GAM1176 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1176 RNA, herein designated GAM RNA, and which when bound by GAM1176 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1176 target proteins.

[16341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1176 gene, herein designated GAM GENE, on one or more GAM1176 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16342] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1176 correlate with, and may be deduced from, the identity of the target genes which GAM1176 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16343] Nucleotide sequences of the GAM1176 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1176 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1176 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1176 are further described hereinbelow with reference to Table 1.

[16344] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1176 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16345] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1177 (GAM1177) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16346] GAM1177 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1177 was detected is described hereinabove with reference to Figs. 2-8.

[16347] GAM1177 gene, herein designated GAM GENE, and GAM1177 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16348] GAM1177 gene, herein designated GAM GENE, encodes a GAM1177 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1177 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1177 precursor RNA is designated SEQ ID:1154, and is provided hereinbelow with reference to the sequence listing part.

[16349] GAM1177 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16350] An enzyme complex designated DICER COMPLEX, dices the GAM1177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1177 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1177 RNA is designated SEQ ID:3756, and is provided hereinbelow with reference to the sequence listing part.

[16351] GAM1177 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1177 target RNA, herein designated GAM TARGET RNA. GAM1177 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16352] GAM1177 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1177 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1177 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1177 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1177 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16353] The complementary binding of GAM1177 RNA, herein designated GAM RNA, to target binding sites on GAM1177 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1177 target RNA, herein designated GAM TARGET RNA, into GAM1177 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16354] It is appreciated that GAM1177 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1177 target genes. The mRNA of each one of this plurality of GAM1177 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1177 RNA, herein designated GAM RNA, and which when bound by GAM1177 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1177 target proteins.

[16355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1177 gene, herein designated GAM GENE, on one or more GAM1177 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16356] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1177 correlate with, and may be deduced from, the identity of the target

genes which GAM1177 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16357] Nucleotide sequences of the GAM1177 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1177 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1177 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1177 are further described hereinbelow with reference to Table 1.

[16358] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1177 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16359] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1178 (GAM1178) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16360] GAM1178 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1178 was detected is described hereinabove with reference to Figs. 2-8.

[16361] GAM1178 gene, herein designated GAM GENE, and GAM1178 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16362] GAM1178 gene, herein designated GAM GENE, encodes a GAM1178 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1178 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1178 precursor RNA is designated SEQ ID:1155, and is provided hereinbelow with reference to the sequence listing part.

[16363] GAM1178 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1178 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16364] An enzyme complex designated DICER COMPLEX, dices the GAM1178 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1178 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1178 RNA is designated SEQ ID:3757, and is provided

hereinbelow with reference to the sequence listing part.

[16365] GAM1178 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1178 target RNA, herein designated GAM TARGET RNA. GAM1178 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16366] GAM1178 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1178 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1178 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1178 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1178 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16367] The complementary binding of GAM1178 RNA, herein designated GAM RNA, to target binding sites on GAM1178 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1178 target RNA, herein designated GAM TARGET RNA, into GAM1178 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16368] It is appreciated that GAM1178 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1178 target genes. The mRNA of each one of this plurality of GAM1178 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1178 RNA, herein designated GAM RNA, and which when bound by GAM1178 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1178 target proteins.

[16369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1178 gene, herein designated GAM GENE, on one or more GAM1178 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16370] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1178 correlate with, and may be deduced from, the identity of the target genes which GAM1178 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16371] Nucleotide sequences of the GAM1178 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1178 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1178 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1178 are further described hereinbelow with reference to Table 1.

[16372] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1178 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16373] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1179 (GAM1179) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16374] GAM1179 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1179 was detected is described hereinabove with reference to Figs. 2-8.

[16375] GAM1179 gene, herein designated GAM GENE, and GAM1179 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16376] GAM1179 gene, herein designated GAM GENE, encodes a GAM1179 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1179 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1179 precursor RNA is designated SEQ ID:1156, and is provided hereinbelow with reference to the sequence listing part.

[16377] GAM1179 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16378] An enzyme complex designated DICER COMPLEX, dices the GAM1179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1179 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1179 RNA is designated SEQ ID:3758, and is provided hereinbelow with reference to the sequence listing part.

[16379] GAM1179 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1179 target RNA, herein designated GAM TARGET RNA. GAM1179 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16380] GAM1179 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1179 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1179 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1179 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1179 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16381] The complementary binding of GAM1179 RNA, herein designated GAM RNA, to target binding sites on GAM1179 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1179 target RNA, herein designated GAM TARGET RNA, into GAM1179 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16382] It is appreciated that GAM1179 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1179 target genes. The mRNA of each one of this plurality of GAM1179 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1179 RNA, herein designated GAM RNA, and which when bound by GAM1179 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1179 target proteins.

[16383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1179 gene, herein designated GAM GENE, on one or more GAM1179 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16384] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1179 correlate with, and may be deduced from, the identity of the target genes which GAM1179 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16385] Nucleotide sequences of the GAM1179 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1179 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1179 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1179 are further described hereinbelow with reference to Table 1.

[16386] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1179 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16387] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1180 (GAM1180) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16388] GAM1180 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1180 was detected is described hereinabove with reference to Figs. 2-8.

[16389] GAM1180 gene, herein designated GAM GENE, and GAM1180 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16390] GAM1180 gene, herein designated GAM GENE, encodes a GAM1180 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1180 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1180 precursor RNA is designated SEQ ID:1157, and is provided hereinbelow with reference to the sequence listing part.

[16391] GAM1180 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16392] An enzyme complex designated DICER COMPLEX, dices the GAM1180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1180 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1180 RNA is designated SEQ ID:3759, and is provided hereinbelow with reference to the sequence listing part.

[16393] GAM1180 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1180 target RNA, herein designated GAM TARGET RNA. GAM1180 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16394] GAM1180 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1180 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1180 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1180 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1180 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16395] The complementary binding of GAM1180 RNA, herein designated GAM RNA, to target binding sites on GAM1180 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1180 target RNA, herein designated GAM TARGET RNA, into GAM1180 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16396] It is appreciated that GAM1180 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1180 target genes. The mRNA of each one of this plurality of GAM1180 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1180 RNA, herein designated GAM RNA, and which when bound by GAM1180 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1180 target proteins.

[16397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1180 gene, herein designated GAM GENE, on one or more GAM1180 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16398] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1180 correlate with, and may be deduced from, the identity of the target genes which GAM1180 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16399] Nucleotide sequences of the GAM1180 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1180 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1180 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1180 are further described hereinbelow with reference to Table 1.

[16400] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1180 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16401] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1181 (GAM1181) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16402] GAM1181 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1181 was detected is described hereinabove with reference to Figs. 2-8.

[16403] GAM1181 gene, herein designated GAM GENE, and GAM1181 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16404] GAM1181 gene, herein designated GAM GENE, encodes a GAM1181 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1181 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1181 precursor RNA is designated SEQ ID:1158, and is provided hereinbelow with reference to the sequence listing part.

[16405] GAM1181 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16406] An enzyme complex designated DICER COMPLEX, dices the GAM1181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1181 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1181 RNA is designated SEQ ID:3760, and is provided hereinbelow with reference to the sequence listing part.

[16407] GAM1181 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1181 target RNA, herein designated GAM TARGET RNA. GAM1181 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16408] GAM1181 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1181 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1181 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1181 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1181 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16409] The complementary binding of GAM1181 RNA, herein designated GAM RNA, to target binding sites on GAM1181 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1181 target RNA, herein designated GAM TARGET RNA, into GAM1181 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16410] It is appreciated that GAM1181 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1181 target genes. The mRNA of each one of this plurality of GAM1181 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1181 RNA, herein designated GAM RNA, and which when bound by GAM1181 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1181 target proteins.

[16411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1181 gene, herein designated GAM GENE, on one or more GAM1181 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16412] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1181 correlate with, and may be deduced from, the identity of the target genes which GAM1181 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16413] Nucleotide sequences of the GAM1181 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1181 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1181 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1181 are further described hereinbelow with reference to Table 1.

[16414] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1181 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16415] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1182 (GAM1182) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16416] GAM1182 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1182 was detected is described hereinabove with reference to Figs. 2-8.

[16417] GAM1182 gene, herein designated GAM GENE, and GAM1182 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16418] GAM1182 gene, herein designated GAM GENE, encodes a GAM1182 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1182 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1182 precursor RNA is designated SEQ ID:1159, and is provided hereinbelow with reference to the sequence listing part.

[16419] GAM1182 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16420] An enzyme complex designated DICER COMPLEX, dices the GAM1182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1182 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1182 RNA is designated SEQ ID:3761, and is provided hereinbelow with reference to the sequence listing part.

[16421] GAM1182 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1182 target RNA, herein designated GAM TARGET RNA. GAM1182 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16422] GAM1182 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1182 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1182 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1182 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1182 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16423] The complementary binding of GAM1182 RNA, herein designated GAM RNA, to target binding sites on GAM1182 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1182 target RNA, herein designated GAM TARGET RNA, into GAM1182 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16424] It is appreciated that GAM1182 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1182 target genes. The

mRNA of each one of this plurality of GAM1182 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1182 RNA, herein designated GAM RNA, and which when bound by GAM1182 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1182 target proteins.

[16425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1182 gene, herein designated GAM GENE, on one or more GAM1182 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16426] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1182 correlate with, and may be deduced from, the identity of the target genes which GAM1182 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16427] Nucleotide sequences of the GAM1182 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1182 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1182 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1182 are further described hereinbelow with reference to Table 1.

[16428] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1182 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16429] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1183 (GAM1183) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16430] GAM1183 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1183 was detected is described hereinabove with reference to Figs. 2-8.

[16431] GAM1183 gene, herein designated GAM GENE, and GAM1183 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16432] GAM1183 gene, herein designated GAM GENE, encodes a GAM1183 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1183 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1183 precursor RNA is designated SEQ ID:1160, and is provided hereinbelow with reference to the sequence listing part.

[16433] GAM1183 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16434] An enzyme complex designated DICER COMPLEX, dices the GAM1183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1183 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1183 RNA is designated SEQ ID:3762, and is provided hereinbelow with reference to the sequence listing part.

[16435] GAM1183 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1183 target RNA, herein designated GAM TARGET RNA. GAM1183 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16436] GAM1183 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1183 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1183 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1183 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1183 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16437] The complementary binding of GAM1183 RNA, herein designated GAM RNA, to target binding sites on GAM1183 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1183 target RNA, herein designated GAM TARGET RNA, into GAM1183 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16438] It is appreciated that GAM1183 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1183 target genes. The mRNA of each one of this plurality of GAM1183 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1183 RNA, herein designated GAM RNA, and which when bound by GAM1183 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1183 target proteins.

[16439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1183 gene, herein designated GAM GENE, on one or more GAM1183 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16440] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1183 correlate with, and may be deduced from, the identity of the target

genes which GAM1183 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16441] Nucleotide sequences of the GAM1183 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1183 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1183 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1183 are further described hereinbelow with reference to Table 1.

[16442] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1183 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16443] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1184 (GAM1184) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16444] GAM1184 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1184 was detected is described hereinabove with reference to Figs. 2-8.

[16445] GAM1184 gene, herein designated GAM GENE, and GAM1184 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16446] GAM1184 gene, herein designated GAM GENE, encodes a GAM1184 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1184 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1184 precursor RNA is designated SEQ ID:1161, and is provided hereinbelow with reference to the sequence listing part.

[16447] GAM1184 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16448] An enzyme complex designated DICER COMPLEX, dices the GAM1184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1184 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1184 RNA is designated SEQ ID:3763, and is provided

hereinbelow with reference to the sequence listing part.

[16449] GAM1184 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1184 target RNA, herein designated GAM TARGET RNA. GAM1184 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16450] GAM1184 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1184 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1184 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1184 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1184 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16451] The complementary binding of GAM1184 RNA, herein designated GAM RNA, to target binding sites on GAM1184 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1184 target RNA, herein designated GAM TARGET RNA, into GAM1184 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16452] It is appreciated that GAM1184 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1184 target genes. The mRNA of each one of this plurality of GAM1184 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1184 RNA, herein designated GAM RNA, and which when bound by GAM1184 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1184 target proteins.

[16453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1184 gene, herein designated GAM GENE, on one or more GAM1184 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16454] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1184 correlate with, and may be deduced from, the identity of the target genes which GAM1184 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16455] Nucleotide sequences of the GAM1184 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1184 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1184 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1184 are further described hereinbelow with reference to Table 1.

[16456] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1184 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16457] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1185 (GAM1185) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16458] GAM1185 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1185 was detected is described hereinabove with reference to Figs. 2-8.

[16459] GAM1185 gene, herein designated GAM GENE, and GAM1185 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16460] GAM1185 gene, herein designated GAM GENE, encodes a GAM1185 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1185 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1185 precursor RNA is designated SEQ ID:1162, and is provided hereinbelow with reference to the sequence listing part.

[16461] GAM1185 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16462] An enzyme complex designated DICER COMPLEX, dices the GAM1185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1185 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1185 RNA is designated SEQ ID:3764, and is provided hereinbelow with reference to the sequence listing part.

[16463] GAM1185 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1185 target RNA, herein designated GAM TARGET RNA. GAM1185 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16464] GAM1185 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1185 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1185 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1185 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1185 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16465] The complementary binding of GAM1185 RNA, herein designated GAM RNA, to target binding sites on GAM1185 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1185 target RNA, herein designated GAM TARGET RNA, into GAM1185 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16466] It is appreciated that GAM1185 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1185 target genes. The mRNA of each one of this plurality of GAM1185 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1185 RNA, herein designated GAM RNA, and which when bound by GAM1185 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1185 target proteins.

[16467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1185 gene, herein designated GAM GENE, on one or more GAM1185 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16468] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1185 correlate with, and may be deduced from, the identity of the target genes which GAM1185 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16469] Nucleotide sequences of the GAM1185 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1185 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1185 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1185 are further described hereinbelow with reference to Table 1.

[16470] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1185 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16471] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1186 (GAM1186) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16472] GAM1186 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1186 was detected is described hereinabove with reference to Figs. 2-8.

[16473] GAM1186 gene, herein designated GAM GENE, and GAM1186 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16474] GAM1186 gene, herein designated GAM GENE, encodes a GAM1186 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1186 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1186 precursor RNA is designated SEQ ID:1163, and is provided hereinbelow with reference to the sequence listing part.

[16475] GAM1186 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16476] An enzyme complex designated DICER COMPLEX, dices the GAM1186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1186 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1186 RNA is designated SEQ ID:3765, and is provided hereinbelow with reference to the sequence listing part.

[16477] GAM1186 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1186 target RNA, herein designated GAM TARGET RNA. GAM1186 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16478] GAM1186 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1186 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1186 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1186 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1186 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16479] The complementary binding of GAM1186 RNA, herein designated GAM RNA, to target binding sites on GAM1186 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1186 target RNA, herein designated GAM TARGET RNA, into GAM1186 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16480] It is appreciated that GAM1186 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1186 target genes. The mRNA of each one of this plurality of GAM1186 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1186 RNA, herein designated GAM RNA, and which when bound by GAM1186 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1186 target proteins.

[16481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1186 gene, herein designated GAM GENE, on one or more GAM1186 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16482] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1186 correlate with, and may be deduced from, the identity of the target genes which GAM1186 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16483] Nucleotide sequences of the GAM1186 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1186 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1186 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1186 are further described hereinbelow with reference to Table 1.

[16484] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1186 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16485] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1187 (GAM1187) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16486] GAM1187 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1187 was detected is described hereinabove with reference to Figs. 2-8.

[16487] GAM1187 gene, herein designated GAM GENE, and GAM1187 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16488] GAM1187 gene, herein designated GAM GENE, encodes a GAM1187 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1187 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1187 precursor RNA is designated SEQ ID:1164, and is provided hereinbelow with reference to the sequence listing part.

[16489] GAM1187 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16490] An enzyme complex designated DICER COMPLEX, dices the GAM1187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1187 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1187 RNA is designated SEQ ID:3766, and is provided hereinbelow with reference to the sequence listing part.

[16491] GAM1187 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1187 target RNA, herein designated GAM TARGET RNA. GAM1187 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16492] GAM1187 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1187 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1187 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1187 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1187 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16493] The complementary binding of GAM1187 RNA, herein designated GAM RNA, to target binding sites on GAM1187 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1187 target RNA, herein designated GAM TARGET RNA, into GAM1187 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16494] It is appreciated that GAM1187 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1187 target genes. The mRNA of each one of this plurality of GAM1187 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1187 RNA, herein designated GAM RNA, and which when bound by GAM1187 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1187 target proteins.

[16495] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1187 gene, herein designated GAM GENE, on one or more GAM1187 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16496] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1187 correlate with, and may be deduced from, the identity of the target genes which GAM1187 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16497] Nucleotide sequences of the GAM1187 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1187 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1187 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1187 are further described hereinbelow with reference to Table 1.

[16498] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1187 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16499] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1188 (GAM1188) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16500] GAM1188 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1188 was detected is described hereinabove with reference to Figs. 2-8.

[16501] GAM1188 gene, herein designated GAM GENE, and GAM1188 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16502] GAM1188 gene, herein designated GAM GENE, encodes a GAM1188 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1188 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1188 precursor RNA is designated SEQ ID:1165, and is provided hereinbelow with reference to the sequence listing part.

[16503] GAM1188 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16504] An enzyme complex designated DICER COMPLEX, dices the GAM1188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1188 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1188 RNA is designated SEQ ID:3767, and is provided hereinbelow with reference to the sequence listing part.

[16505] GAM1188 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1188 target RNA, herein designated GAM TARGET RNA. GAM1188 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16506] GAM1188 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1188 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1188 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1188 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1188 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16507] The complementary binding of GAM1188 RNA, herein designated GAM RNA, to target binding sites on GAM1188 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1188 target RNA, herein designated GAM TARGET RNA, into GAM1188 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16508] It is appreciated that GAM1188 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1188 target genes. The

mRNA of each one of this plurality of GAM1188 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1188 RNA, herein designated GAM RNA, and which when bound by GAM1188 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1188 target proteins.

[16509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1188 gene, herein designated GAM GENE, on one or more GAM1188 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16510] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1188 correlate with, and may be deduced from, the identity of the target genes which GAM1188 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16511] Nucleotide sequences of the GAM1188 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1188 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1188 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1188 are further described hereinbelow with reference to Table 1.

[16512] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1188 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16513] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1189 (GAM1189) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16514] GAM1189 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1189 was detected is described hereinabove with reference to Figs. 2-8.

[16515] GAM1189 gene, herein designated GAM GENE, and GAM1189 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16516] GAM1189 gene, herein designated GAM GENE, encodes a GAM1189 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1189 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1189 precursor RNA is designated SEQ ID:1166, and is provided hereinbelow with reference to the sequence listing part.

[16517] GAM1189 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16518] An enzyme complex designated DICER COMPLEX, dices the GAM1189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1189 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1189 RNA is designated SEQ ID:3768, and is provided hereinbelow with reference to the sequence listing part.

[16519] GAM1189 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1189 target RNA, herein designated GAM TARGET RNA. GAM1189 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16520] GAM1189 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1189 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1189 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1189 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1189 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16521] The complementary binding of GAM1189 RNA, herein designated GAM RNA, to target binding sites on GAM1189 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1189 target RNA, herein designated GAM TARGET RNA, into GAM1189 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16522] It is appreciated that GAM1189 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1189 target genes. The mRNA of each one of this plurality of GAM1189 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1189 RNA, herein designated GAM RNA, and which when bound by GAM1189 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1189 target proteins.

[16523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1189 gene, herein designated GAM GENE, on one or more GAM1189 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16524] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1189 correlate with, and may be deduced from, the identity of the target

genes which GAM1189 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16525] Nucleotide sequences of the GAM1189 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1189 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1189 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1189 are further described hereinbelow with reference to Table 1.

[16526] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1189 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16527] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1190 (GAM1190) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16528] GAM1190 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1190 was detected is described hereinabove with reference to Figs. 2-8.

[16529] GAM1190 gene, herein designated GAM GENE, and GAM1190 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16530] GAM1190 gene, herein designated GAM GENE, encodes a GAM1190 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1190 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1190 precursor RNA is designated SEQ ID:1167, and is provided hereinbelow with reference to the sequence listing part.

[16531] GAM1190 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16532] An enzyme complex designated DICER COMPLEX, dices the GAM1190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1190 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1190 RNA is designated SEQ ID:3769, and is provided

hereinbelow with reference to the sequence listing part.

[16533] GAM1190 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1190 target RNA, herein designated GAM TARGET RNA. GAM1190 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16534] GAM1190 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1190 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1190 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1190 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1190 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16535] The complementary binding of GAM1190 RNA, herein designated GAM RNA, to target binding sites on GAM1190 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1190 target RNA, herein designated GAM TARGET RNA, into GAM1190 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16536] It is appreciated that GAM1190 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1190 target genes. The mRNA of each one of this plurality of GAM1190 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1190 RNA, herein designated GAM RNA, and which when bound by GAM1190 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1190 target proteins.

[16537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1190 gene, herein designated GAM GENE, on one or more GAM1190 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16538] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1190 correlate with, and may be deduced from, the identity of the target genes which GAM1190 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16539] Nucleotide sequences of the GAM1190 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1190 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1190 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1190 are further described hereinbelow with reference to Table 1.

[16540] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1190 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16541] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1191 (GAM1191) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16542] GAM1191 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1191 was detected is described hereinabove with reference to Figs. 2-8.

[16543] GAM1191 gene, herein designated GAM GENE, and GAM1191 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16544] GAM1191 gene, herein designated GAM GENE, encodes a GAM1191 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1191 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1191 precursor RNA is designated SEQ ID:1168, and is provided hereinbelow with reference to the sequence listing part.

[16545] GAM1191 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16546] An enzyme complex designated DICER COMPLEX, dices the GAM1191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1191 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1191 RNA is designated SEQ ID:3770, and is provided hereinbelow with reference to the sequence listing part.

[16547] GAM1191 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1191 target RNA, herein designated GAM TARGET RNA. GAM1191 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16548] GAM1191 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1191 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1191 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1191 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1191 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16549] The complementary binding of GAM1191 RNA, herein designated GAM RNA, to target binding sites on GAM1191 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1191 target RNA, herein designated GAM TARGET RNA, into GAM1191 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16550] It is appreciated that GAM1191 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1191 target genes. The mRNA of each one of this plurality of GAM1191 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1191 RNA, herein designated GAM RNA, and which when bound by GAM1191 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1191 target proteins.

[16551] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1191 gene, herein designated GAM GENE, on one or more GAM1191 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16552] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1191 correlate with, and may be deduced from, the identity of the target genes which GAM1191 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16553] Nucleotide sequences of the GAM1191 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1191 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1191 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1191 are further described hereinbelow with reference to Table 1.

[16554] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1191 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16555] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1192 (GAM1192) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16556] GAM1192 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1192 was detected is described hereinabove with reference to Figs. 2-8.

[16557] GAM1192 gene, herein designated GAM GENE, and GAM1192 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16558] GAM1192 gene, herein designated GAM GENE, encodes a GAM1192 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1192 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1192 precursor RNA is designated SEQ ID:1169, and is provided hereinbelow with reference to the sequence listing part.

[16559] GAM1192 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16560] An enzyme complex designated DICER COMPLEX, dices the GAM1192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1192 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1192 RNA is designated SEQ ID:3771, and is provided hereinbelow with reference to the sequence listing part.

[16561] GAM1192 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1192 target RNA, herein designated GAM TARGET RNA. GAM1192 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16562] GAM1192 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1192 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1192 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1192 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1192 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16563] The complementary binding of GAM1192 RNA, herein designated GAM RNA, to target binding sites on GAM1192 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1192 target RNA, herein designated GAM TARGET RNA, into GAM1192 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16564] It is appreciated that GAM1192 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1192 target genes. The mRNA of each one of this plurality of GAM1192 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1192 RNA, herein designated GAM RNA, and which when bound by GAM1192 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1192 target proteins.

[16565] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1192 gene, herein designated GAM GENE, on one or more GAM1192 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16566] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1192 correlate with, and may be deduced from, the identity of the target genes which GAM1192 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16567] Nucleotide sequences of the GAM1192 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1192 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1192 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1192 are further described hereinbelow with reference to Table 1.

[16568] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1192 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16569] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1193 (GAM1193) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16570] GAM1193 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1193 was detected is described hereinabove with reference to Figs. 2-8.

[16571] GAM1193 gene, herein designated GAM GENE, and GAM1193 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16572] GAM1193 gene, herein designated GAM GENE, encodes a GAM1193 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1193 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1193 precursor RNA is designated SEQ ID:1170, and is provided hereinbelow with reference to the sequence listing part.

[16573] GAM1193 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16574] An enzyme complex designated DICER COMPLEX, dices the GAM1193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1193 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1193 RNA is designated SEQ ID:3773, and is provided hereinbelow with reference to the sequence listing part.

[16575] GAM1193 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1193 target RNA, herein designated GAM TARGET RNA. GAM1193 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16576] GAM1193 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1193 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1193 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1193 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1193 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16577] The complementary binding of GAM1193 RNA, herein designated GAM RNA, to target binding sites on GAM1193 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1193 target RNA, herein designated GAM TARGET RNA, into GAM1193 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16578] It is appreciated that GAM1193 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1193 target genes. The mRNA of each one of this plurality of GAM1193 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1193 RNA, herein designated GAM RNA, and which when bound by GAM1193 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1193 target proteins.

[16579] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1193 gene, herein designated GAM GENE, on one or more GAM1193 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16580] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1193 correlate with, and may be deduced from, the identity of the target genes which GAM1193 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16581] Nucleotide sequences of the GAM1193 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1193 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1193 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1193 are further described hereinbelow with reference to Table 1.

[16582] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1193 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16583] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1194 (GAM1194) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16584] GAM1194 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1194 was detected is described hereinabove with reference to Figs. 2-8.

[16585] GAM1194 gene, herein designated GAM GENE, and GAM1194 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16586] GAM1194 gene, herein designated GAM GENE, encodes a GAM1194 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1194 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1194 precursor RNA is designated SEQ ID:1171, and is provided hereinbelow with reference to the sequence listing part.

[16587] GAM1194 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16588] An enzyme complex designated DICER COMPLEX, dices the GAM1194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1194 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1194 RNA is designated SEQ ID:3772, and is provided hereinbelow with reference to the sequence listing part.

[16589] GAM1194 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1194 target RNA, herein designated GAM TARGET RNA. GAM1194 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16590] GAM1194 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1194 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1194 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1194 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1194 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16591] The complementary binding of GAM1194 RNA, herein designated GAM RNA, to target binding sites on GAM1194 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1194 target RNA, herein designated GAM TARGET RNA, into GAM1194 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16592] It is appreciated that GAM1194 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1194 target genes. The

mRNA of each one of this plurality of GAM1194 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1194 RNA, herein designated GAM RNA, and which when bound by GAM1194 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1194 target proteins.

[16593] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1194 gene, herein designated GAM GENE, on one or more GAM1194 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16594] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1194 correlate with, and may be deduced from, the identity of the target genes which GAM1194 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16595] Nucleotide sequences of the GAM1194 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1194 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1194 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1194 are further described hereinbelow with reference to Table 1.

[16596] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1194 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16597] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1195 (GAM1195) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16598] GAM1195 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1195 was detected is described hereinabove with reference to Figs. 2-8.

[16599] GAM1195 gene, herein designated GAM GENE, and GAM1195 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16600] GAM1195 gene, herein designated GAM GENE, encodes a GAM1195 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1195 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1195 precursor RNA is designated SEQ ID:1172, and is provided hereinbelow with reference to the sequence listing part.

[16601] GAM1195 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16602] An enzyme complex designated DICER COMPLEX, dices the GAM1195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1195 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1195 RNA is designated SEQ ID:3774, and is provided hereinbelow with reference to the sequence listing part.

[16603] GAM1195 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1195 target RNA, herein designated GAM TARGET RNA. GAM1195 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16604] GAM1195 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1195 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1195 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1195 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1195 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16605] The complementary binding of GAM1195 RNA, herein designated GAM RNA, to target binding sites on GAM1195 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1195 target RNA, herein designated GAM TARGET RNA, into GAM1195 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16606] It is appreciated that GAM1195 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1195 target genes. The mRNA of each one of this plurality of GAM1195 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1195 RNA, herein designated GAM RNA, and which when bound by GAM1195 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1195 target proteins.

[16607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1195 gene, herein designated GAM GENE, on one or more GAM1195 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16608] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1195 correlate with, and may be deduced from, the identity of the target

genes which GAM1195 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16609] Nucleotide sequences of the GAM1195 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1195 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1195 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1195 are further described hereinbelow with reference to Table 1.

[16610] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1195 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16611] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1196 (GAM1196) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16612] GAM1196 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1196 was detected is described hereinabove with reference to Figs. 2-8.

[16613] GAM1196 gene, herein designated GAM GENE, and GAM1196 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16614] GAM1196 gene, herein designated GAM GENE, encodes a GAM1196 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1196 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1196 precursor RNA is designated SEQ ID:1173, and is provided hereinbelow with reference to the sequence listing part.

[16615] GAM1196 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16616] An enzyme complex designated DICER COMPLEX, dices the GAM1196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1196 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1196 RNA is designated SEQ ID:3775, and is provided

hereinbelow with reference to the sequence listing part.

[16617] GAM1196 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1196 target RNA, herein designated GAM TARGET RNA. GAM1196 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16618] GAM1196 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1196 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1196 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1196 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1196 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16619] The complementary binding of GAM1196 RNA, herein designated GAM RNA, to target binding sites on GAM1196 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1196 target RNA, herein designated GAM TARGET RNA, into GAM1196 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16620] It is appreciated that GAM1196 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1196 target genes. The mRNA of each one of this plurality of GAM1196 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1196 RNA, herein designated GAM RNA, and which when bound by GAM1196 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1196 target proteins.

[16621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1196 gene, herein designated GAM GENE, on one or more GAM1196 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16622] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1196 correlate with, and may be deduced from, the identity of the target genes which GAM1196 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16623] Nucleotide sequences of the GAM1196 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1196 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1196 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1196 are further described hereinbelow with reference to Table 1.

[16624] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1196 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16625] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1197 (GAM1197) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16626] GAM1197 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1197 was detected is described hereinabove with reference to Figs. 2-8.

[16627] GAM1197 gene, herein designated GAM GENE, and GAM1197 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16628] GAM1197 gene, herein designated GAM GENE, encodes a GAM1197 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1197 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1197 precursor RNA is designated SEQ ID:1174, and is provided hereinbelow with reference to the sequence listing part.

[16629] GAM1197 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16630] An enzyme complex designated DICER COMPLEX, dices the GAM1197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1197 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1197 RNA is designated SEQ ID:3776, and is provided hereinbelow with reference to the sequence listing part.

[16631] GAM1197 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1197 target RNA, herein designated GAM TARGET RNA. GAM1197 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16632] GAM1197 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1197 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1197 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1197 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1197 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16633] The complementary binding of GAM1197 RNA, herein designated GAM RNA, to target binding sites on GAM1197 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1197 target RNA, herein designated GAM TARGET RNA, into GAM1197 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16634] It is appreciated that GAM1197 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1197 target genes. The mRNA of each one of this plurality of GAM1197 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1197 RNA, herein designated GAM RNA, and which when bound by GAM1197 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1197 target proteins.

[16635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1197 gene, herein designated GAM GENE, on one or more GAM1197 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16636] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1197 correlate with, and may be deduced from, the identity of the target genes which GAM1197 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16637] Nucleotide sequences of the GAM1197 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1197 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1197 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1197 are further described hereinbelow with reference to Table 1.

[16638] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1197 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16639] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1198 (GAM1198) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16640] GAM1198 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1198 was detected is described hereinabove with reference to Figs. 2-8.

[16641] GAM1198 gene, herein designated GAM GENE, and GAM1198 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16642] GAM1198 gene, herein designated GAM GENE, encodes a GAM1198 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1198 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1198 precursor RNA is designated SEQ ID:1175, and is provided hereinbelow with reference to the sequence listing part.

[16643] GAM1198 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1198 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16644] An enzyme complex designated DICER COMPLEX, dices the GAM1198 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1198 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1198 RNA is designated SEQ ID:3777, and is provided hereinbelow with reference to the sequence listing part.

[16645] GAM1198 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1198 target RNA, herein designated GAM TARGET RNA. GAM1198 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16646] GAM1198 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1198 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1198 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1198 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1198 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16647] The complementary binding of GAM1198 RNA, herein designated GAM RNA, to target binding sites on GAM1198 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1198 target RNA, herein designated GAM TARGET RNA, into GAM1198 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16648] It is appreciated that GAM1198 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1198 target genes. The mRNA of each one of this plurality of GAM1198 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1198 RNA, herein designated GAM RNA, and which when bound by GAM1198 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1198 target proteins.

[16649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1198 gene, herein designated GAM GENE, on one or more GAM1198 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16650] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1198 correlate with, and may be deduced from, the identity of the target genes which GAM1198 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16651] Nucleotide sequences of the GAM1198 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1198 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1198 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1198 are further described hereinbelow with reference to Table 1.

[16652] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1198 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16653] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1199 (GAM1199) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16654] GAM1199 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1199 was detected is described hereinabove with reference to Figs. 2-8.

[16655] GAM1199 gene, herein designated GAM GENE, and GAM1199 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16656] GAM1199 gene, herein designated GAM GENE, encodes a GAM1199 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1199 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1199 precursor RNA is designated SEQ ID:1176, and is provided hereinbelow with reference to the sequence listing part.

[16657] GAM1199 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16658] An enzyme complex designated DICER COMPLEX, dices the GAM1199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1199 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1199 RNA is designated SEQ ID:3778, and is provided hereinbelow with reference to the sequence listing part.

[16659] GAM1199 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1199 target RNA, herein designated GAM TARGET RNA. GAM1199 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16660] GAM1199 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1199 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1199 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1199 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1199 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16661] The complementary binding of GAM1199 RNA, herein designated GAM RNA, to target binding sites on GAM1199 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1199 target RNA, herein designated GAM TARGET RNA, into GAM1199 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16662] It is appreciated that GAM1199 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1199 target genes. The mRNA of each one of this plurality of GAM1199 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1199 RNA, herein designated GAM RNA, and which when bound by GAM1199 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1199 target proteins.

[16663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1199 gene, herein designated GAM GENE, on one or more GAM1199 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16664] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1199 correlate with, and may be deduced from, the identity of the target genes which GAM1199 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16665] Nucleotide sequences of the GAM1199 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1199 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1199 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1199 are further described hereinbelow with reference to Table 1.

[16666] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1199 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16667] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1200 (GAM1200) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16668] GAM1200 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1200 was detected is described hereinabove with reference to Figs. 2-8.

[16669] GAM1200 gene, herein designated GAM GENE, and GAM1200 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16670] GAM1200 gene, herein designated GAM GENE, encodes a GAM1200 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1200 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1200 precursor RNA is designated SEQ ID:1177, and is provided hereinbelow with reference to the sequence listing part.

[16671] GAM1200 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16672] An enzyme complex designated DICER COMPLEX, dices the GAM1200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1200 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1200 RNA is designated SEQ ID:3780, and is provided hereinbelow with reference to the sequence listing part.

[16673] GAM1200 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1200 target RNA, herein designated GAM TARGET RNA. GAM1200 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16674] GAM1200 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1200 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1200 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1200 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1200 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16675] The complementary binding of GAM1200 RNA, herein designated GAM RNA, to target binding sites on GAM1200 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1200 target RNA, herein designated GAM TARGET RNA, into GAM1200 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16676] It is appreciated that GAM1200 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1200 target genes. The

mRNA of each one of this plurality of GAM1200 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1200 RNA, herein designated GAM RNA, and which when bound by GAM1200 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1200 target proteins.

[16677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1200 gene, herein designated GAM GENE, on one or more GAM1200 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16678] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1200 correlate with, and may be deduced from, the identity of the target genes which GAM1200 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16679] Nucleotide sequences of the GAM1200 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1200 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1200 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1200 are further described hereinbelow with reference to Table 1.

[16680] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1200 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16681] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1201 (GAM1201) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16682] GAM1201 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1201 was detected is described hereinabove with reference to Figs. 2-8.

[16683] GAM1201 gene, herein designated GAM GENE, and GAM1201 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16684] GAM1201 gene, herein designated GAM GENE, encodes a GAM1201 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1201 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1201 precursor RNA is designated SEQ ID:1178, and is provided hereinbelow with reference to the sequence listing part.

[16685] GAM1201 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16686] An enzyme complex designated DICER COMPLEX, dices the GAM1201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1201 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1201 RNA is designated SEQ ID:3779, and is provided hereinbelow with reference to the sequence listing part.

[16687] GAM1201 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1201 target RNA, herein designated GAM TARGET RNA. GAM1201 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16688] GAM1201 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1201 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1201 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1201 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1201 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16689] The complementary binding of GAM1201 RNA, herein designated GAM RNA, to target binding sites on GAM1201 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1201 target RNA, herein designated GAM TARGET RNA, into GAM1201 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16690] It is appreciated that GAM1201 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1201 target genes. The mRNA of each one of this plurality of GAM1201 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1201 RNA, herein designated GAM RNA, and which when bound by GAM1201 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1201 target proteins.

[16691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1201 gene, herein designated GAM GENE, on one or more GAM1201 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16692] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1201 correlate with, and may be deduced from, the identity of the target

genes which GAM1201 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16693] Nucleotide sequences of the GAM1201 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1201 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1201 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1201 are further described hereinbelow with reference to Table 1.

[16694] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1201 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16695] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1202 (GAM1202) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16696] GAM1202 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1202 was detected is described hereinabove with reference to Figs. 2-8.

[16697] GAM1202 gene, herein designated GAM GENE, and GAM1202 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16698] GAM1202 gene, herein designated GAM GENE, encodes a GAM1202 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1202 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1202 precursor RNA is designated SEQ ID:1179, and is provided hereinbelow with reference to the sequence listing part.

[16699] GAM1202 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16700] An enzyme complex designated DICER COMPLEX, dices the GAM1202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1202 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1202 RNA is designated SEQ ID:3781, and is provided

hereinbelow with reference to the sequence listing part.

[16701] GAM1202 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1202 target RNA, herein designated GAM TARGET RNA. GAM1202 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16702] GAM1202 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1202 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1202 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1202 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1202 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16703] The complementary binding of GAM1202 RNA, herein designated GAM RNA, to target binding sites on GAM1202 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1202 target RNA, herein designated GAM TARGET RNA, into GAM1202 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16704] It is appreciated that GAM1202 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1202 target genes. The mRNA of each one of this plurality of GAM1202 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1202 RNA, herein designated GAM RNA, and which when bound by GAM1202 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1202 target proteins.

[16705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1202 gene, herein designated GAM GENE, on one or more GAM1202 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16706] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1202 correlate with, and may be deduced from, the identity of the target genes which GAM1202 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16707] Nucleotide sequences of the GAM1202 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1202 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1202 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1202 are further described hereinbelow with reference to Table 1.

[16708] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1202 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16709] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1203 (GAM1203) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16710] GAM1203 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1203 was detected is described hereinabove with reference to Figs. 2-8.

[16711] GAM1203 gene, herein designated GAM GENE, and GAM1203 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16712] GAM1203 gene, herein designated GAM GENE, encodes a GAM1203 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1203 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1203 precursor RNA is designated SEQ ID:1180, and is provided hereinbelow with reference to the sequence listing part.

[16713] GAM1203 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16714] An enzyme complex designated DICER COMPLEX, dices the GAM1203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1203 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM1203 RNA is designated SEQ ID:3782, and is provided hereinbelow with reference to the sequence listing part.

[16715] GAM1203 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1203 target RNA, herein designated GAM TARGET RNA. GAM1203 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16716] GAM1203 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1203 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1203 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1203 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1203 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16717] The complementary binding of GAM1203 RNA, herein designated GAM RNA, to target binding sites on GAM1203 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1203 target RNA, herein designated GAM TARGET RNA, into GAM1203 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16718] It is appreciated that GAM1203 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1203 target genes. The mRNA of each one of this plurality of GAM1203 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1203 RNA, herein designated GAM RNA, and which when bound by GAM1203 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1203 target proteins.

[16719] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1203 gene, herein designated GAM GENE, on one or more GAM1203 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16720] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1203 correlate with, and may be deduced from, the identity of the target genes which GAM1203 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16721] Nucleotide sequences of the GAM1203 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1203 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1203 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1203 are further described hereinbelow with reference to Table 1.

[16722] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1203 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16723] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1204 (GAM1204) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16724] GAM1204 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1204 was detected is described hereinabove with reference to Figs. 2-8.

[16725] GAM1204 gene, herein designated GAM GENE, and GAM1204 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16726] GAM1204 gene, herein designated GAM GENE, encodes a GAM1204 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1204 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1204 precursor RNA is designated SEQ ID:1181, and is provided hereinbelow with reference to the sequence listing part.

[16727] GAM1204 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16728] An enzyme complex designated DICER COMPLEX, dices the GAM1204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1204 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1204 RNA is designated SEQ ID:3783, and is provided hereinbelow with reference to the sequence listing part.

[16729] GAM1204 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1204 target RNA, herein designated GAM TARGET RNA. GAM1204 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16730] GAM1204 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1204 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1204 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1204 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1204 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16731] The complementary binding of GAM1204 RNA, herein designated GAM RNA, to target binding sites on GAM1204 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1204 target RNA, herein designated GAM TARGET RNA, into GAM1204 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16732] It is appreciated that GAM1204 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1204 target genes. The mRNA of each one of this plurality of GAM1204 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1204 RNA, herein designated GAM RNA, and which when bound by GAM1204 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1204 target proteins.

[16733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1204 gene, herein designated GAM GENE, on one or more GAM1204 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16734] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1204 correlate with, and may be deduced from, the identity of the target genes which GAM1204 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16735] Nucleotide sequences of the GAM1204 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1204 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1204 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1204 are further described hereinbelow with reference to Table 1.

[16736] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1204 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16737] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1205 (GAM1205) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16738] GAM1205 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1205 was detected is described hereinabove with reference to Figs. 2-8.

[16739] GAM1205 gene, herein designated GAM GENE, and GAM1205 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16740] GAM1205 gene, herein designated GAM GENE, encodes a GAM1205 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1205 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1205 precursor RNA is designated SEQ ID:1182, and is provided hereinbelow with reference to the sequence listing part.

[16741] GAM1205 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16742] An enzyme complex designated DICER COMPLEX, dices the GAM1205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1205 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1205 RNA is designated SEQ ID:3784, and is provided hereinbelow with reference to the sequence listing part.

[16743] GAM1205 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1205 target RNA, herein designated GAM TARGET RNA. GAM1205 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16744] GAM1205 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1205 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1205 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1205 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1205 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16745] The complementary binding of GAM1205 RNA, herein designated GAM RNA, to target binding sites on GAM1205 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1205 target RNA, herein designated GAM TARGET RNA, into GAM1205 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16746] It is appreciated that GAM1205 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1205 target genes. The mRNA of each one of this plurality of GAM1205 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1205 RNA, herein designated GAM RNA, and which when bound by GAM1205 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1205 target proteins.

[16747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1205 gene, herein designated GAM GENE, on one or more GAM1205 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16748] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1205 correlate with, and may be deduced from, the identity of the target genes which GAM1205 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16749] Nucleotide sequences of the GAM1205 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1205 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1205 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1205 are further described hereinbelow with reference to Table 1.

[16750] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1205 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16751] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1206 (GAM1206) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16752] GAM1206 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1206 was detected is described hereinabove with reference to Figs. 2-8.

[16753] GAM1206 gene, herein designated GAM GENE, and GAM1206 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16754] GAM1206 gene, herein designated GAM GENE, encodes a GAM1206 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1206 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1206 precursor RNA is designated SEQ ID:1183, and is provided hereinbelow with reference to the sequence listing part.

[16755] GAM1206 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16756] An enzyme complex designated DICER COMPLEX, dices the GAM1206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1206 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1206 RNA is designated SEQ ID:3785, and is provided hereinbelow with reference to the sequence listing part.

[16757] GAM1206 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1206 target RNA, herein designated GAM TARGET RNA. GAM1206 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16758] GAM1206 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1206 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1206 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1206 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1206 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16759] The complementary binding of GAM1206 RNA, herein designated GAM RNA, to target binding sites on GAM1206 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1206 target RNA, herein designated GAM TARGET RNA, into GAM1206 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16760] It is appreciated that GAM1206 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1206 target genes. The

mRNA of each one of this plurality of GAM1206 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1206 RNA, herein designated GAM RNA, and which when bound by GAM1206 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1206 target proteins.

[16761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1206 gene, herein designated GAM GENE, on one or more GAM1206 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16762] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1206 correlate with, and may be deduced from, the identity of the target genes which GAM1206 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16763] Nucleotide sequences of the GAM1206 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1206 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1206 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1206 are further described hereinbelow with reference to Table 1.

[16764] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1206 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16765] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1207 (GAM1207) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16766] GAM1207 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1207 was detected is described hereinabove with reference to Figs. 2-8.

[16767] GAM1207 gene, herein designated GAM GENE, and GAM1207 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16768] GAM1207 gene, herein designated GAM GENE, encodes a GAM1207 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1207 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1207 precursor RNA is designated SEQ ID:1184, and is provided hereinbelow with reference to the sequence listing part.

[16769] GAM1207 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16770] An enzyme complex designated DICER COMPLEX, dices the GAM1207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1207 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1207 RNA is designated SEQ ID:3786, and is provided hereinbelow with reference to the sequence listing part.

[16771] GAM1207 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1207 target RNA, herein designated GAM TARGET RNA. GAM1207 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16772] GAM1207 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1207 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1207 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1207 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1207 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16773] The complementary binding of GAM1207 RNA, herein designated GAM RNA, to target binding sites on GAM1207 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1207 target RNA, herein designated GAM TARGET RNA, into GAM1207 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16774] It is appreciated that GAM1207 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1207 target genes. The mRNA of each one of this plurality of GAM1207 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1207 RNA, herein designated GAM RNA, and which when bound by GAM1207 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1207 target proteins.

[16775] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1207 gene, herein designated GAM GENE, on one or more GAM1207 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16776] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1207 correlate with, and may be deduced from, the identity of the target

genes which GAM1207 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16777] Nucleotide sequences of the GAM1207 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1207 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1207 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1207 are further described hereinbelow with reference to Table 1.

[16778] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1207 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16779] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1208 (GAM1208) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16780] GAM1208 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1208 was detected is described hereinabove with reference to Figs. 2-8.

[16781] GAM1208 gene, herein designated GAM GENE, and GAM1208 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16782] GAM1208 gene, herein designated GAM GENE, encodes a GAM1208 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1208 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1208 precursor RNA is designated SEQ ID:1185, and is provided hereinbelow with reference to the sequence listing part.

[16783] GAM1208 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16784] An enzyme complex designated DICER COMPLEX, dices the GAM1208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1208 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1208 RNA is designated SEQ ID:3787, and is provided

hereinbelow with reference to the sequence listing part.

[16785] GAM1208 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1208 target RNA, herein designated GAM TARGET RNA. GAM1208 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16786] GAM1208 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1208 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1208 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1208 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1208 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16787] The complementary binding of GAM1208 RNA, herein designated GAM RNA, to target binding sites on GAM1208 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1208 target RNA, herein designated GAM TARGET RNA, into GAM1208 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16788] It is appreciated that GAM1208 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1208 target genes. The mRNA of each one of this plurality of GAM1208 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1208 RNA, herein designated GAM RNA, and which when bound by GAM1208 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1208 target proteins.

[16789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1208 gene, herein designated GAM GENE, on one or more GAM1208 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16790] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1208 correlate with, and may be deduced from, the identity of the target genes which GAM1208 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16791] Nucleotide sequences of the GAM1208 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1208 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1208 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1208 are further described hereinbelow with reference to Table 1.

[16792] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1208 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16793] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1209 (GAM1209) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16794] GAM1209 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1209 was detected is described hereinabove with reference to Figs. 2-8.

[16795] GAM1209 gene, herein designated GAM GENE, and GAM1209 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16796] GAM1209 gene, herein designated GAM GENE, encodes a GAM1209 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1209 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1209 precursor RNA is designated SEQ ID:1186, and is provided hereinbelow with reference to the sequence listing part.

[16797] GAM1209 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16798] An enzyme complex designated DICER COMPLEX, dices the GAM1209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1209 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1209 RNA is designated SEQ ID:3788, and is provided hereinbelow with reference to the sequence listing part.

[16799] GAM1209 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1209 target RNA, herein designated GAM TARGET RNA. GAM1209 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16800] GAM1209 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1209 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1209 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1209 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1209 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16801] The complementary binding of GAM1209 RNA, herein designated GAM RNA, to target binding sites on GAM1209 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1209 target RNA, herein designated GAM TARGET RNA, into GAM1209 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16802] It is appreciated that GAM1209 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1209 target genes. The mRNA of each one of this plurality of GAM1209 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1209 RNA, herein designated GAM RNA, and which when bound by GAM1209 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1209 target proteins.

[16803] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1209 gene, herein designated GAM GENE, on one or more GAM1209 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16804] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1209 correlate with, and may be deduced from, the identity of the target genes which GAM1209 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16805] Nucleotide sequences of the GAM1209 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1209 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1209 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1209 are further described hereinbelow with reference to Table 1.

[16806] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1209 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16807] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1210 (GAM1210) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16808] GAM1210 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1210 was detected is described hereinabove with reference to Figs. 2-8.

[16809] GAM1210 gene, herein designated GAM GENE, and GAM1210 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16810] GAM1210 gene, herein designated GAM GENE, encodes a GAM1210 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1210 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1210 precursor RNA is designated SEQ ID:1187, and is provided hereinbelow with reference to the sequence listing part.

[16811] GAM1210 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16812] An enzyme complex designated DICER COMPLEX, dices the GAM1210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1210 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1210 RNA is designated SEQ ID:3789, and is provided hereinbelow with reference to the sequence listing part.

[16813] GAM1210 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1210 target RNA, herein designated GAM TARGET RNA. GAM1210 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16814] GAM1210 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1210 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1210 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1210 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1210 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16815] The complementary binding of GAM1210 RNA, herein designated GAM RNA, to target binding sites on GAM1210 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1210 target RNA, herein designated GAM TARGET RNA, into GAM1210 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16816] It is appreciated that GAM1210 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1210 target genes. The mRNA of each one of this plurality of GAM1210 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1210 RNA, herein designated GAM RNA, and which when bound by GAM1210 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1210 target proteins.

[16817] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1210 gene, herein designated GAM GENE, on one or more GAM1210 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16818] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1210 correlate with, and may be deduced from, the identity of the target genes which GAM1210 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16819] Nucleotide sequences of the GAM1210 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1210 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1210 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1210 are further described hereinbelow with reference to Table 1.

[16820] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1210 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16821] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1211 (GAM1211) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16822] GAM1211 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1211 was detected is described hereinabove with reference to Figs. 2-8.

[16823] GAM1211 gene, herein designated GAM GENE, and GAM1211 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16824] GAM1211 gene, herein designated GAM GENE, encodes a GAM1211 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1211 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1211 precursor RNA is designated SEQ ID:1188, and is provided hereinbelow with reference to the sequence listing part.

[16825] GAM1211 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16826] An enzyme complex designated DICER COMPLEX, dices the GAM1211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1211 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1211 RNA is designated SEQ ID:3790, and is provided hereinbelow with reference to the sequence listing part.

[16827] GAM1211 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1211 target RNA, herein designated GAM TARGET RNA. GAM1211 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16828] GAM1211 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1211 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1211 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1211 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1211 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16829] The complementary binding of GAM1211 RNA, herein designated GAM RNA, to target binding sites on GAM1211 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1211 target RNA, herein designated GAM TARGET RNA, into GAM1211 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16830] It is appreciated that GAM1211 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1211 target genes. The mRNA of each one of this plurality of GAM1211 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1211 RNA, herein designated GAM RNA, and which when bound by GAM1211 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1211 target proteins.

[16831] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1211 gene, herein designated GAM GENE, on one or more GAM1211 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16832] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1211 correlate with, and may be deduced from, the identity of the target genes which GAM1211 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16833] Nucleotide sequences of the GAM1211 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1211 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1211 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1211 are further described hereinbelow with reference to Table 1.

[16834] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1211 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16835] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1212 (GAM1212) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16836] GAM1212 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1212 was detected is described hereinabove with reference to Figs. 2-8.

[16837] GAM1212 gene, herein designated GAM GENE, and GAM1212 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16838] GAM1212 gene, herein designated GAM GENE, encodes a GAM1212 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1212 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1212 precursor RNA is designated SEQ ID:1189, and is provided hereinbelow with reference to the sequence listing part.

[16839] GAM1212 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16840] An enzyme complex designated DICER COMPLEX, dices the GAM1212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1212 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1212 RNA is designated SEQ ID:3791, and is provided hereinbelow with reference to the sequence listing part.

[16841] GAM1212 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1212 target RNA, herein designated GAM TARGET RNA. GAM1212 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16842] GAM1212 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1212 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1212 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1212 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1212 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16843] The complementary binding of GAM1212 RNA, herein designated GAM RNA, to target binding sites on GAM1212 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1212 target RNA, herein designated GAM TARGET RNA, into GAM1212 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16844] It is appreciated that GAM1212 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1212 target genes. The

mRNA of each one of this plurality of GAM1212 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1212 RNA, herein designated GAM RNA, and which when bound by GAM1212 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1212 target proteins.

[16845] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1212 gene, herein designated GAM GENE, on one or more GAM1212 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16846] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1212 correlate with, and may be deduced from, the identity of the target genes which GAM1212 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16847] Nucleotide sequences of the GAM1212 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1212 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1212 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1212 are further described hereinbelow with reference to Table 1.

[16848] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1212 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16849] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1213 (GAM1213) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16850] GAM1213 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1213 was detected is described hereinabove with reference to Figs. 2-8.

[16851] GAM1213 gene, herein designated GAM GENE, and GAM1213 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16852] GAM1213 gene, herein designated GAM GENE, encodes a GAM1213 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1213 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1213 precursor RNA is designated SEQ ID:1190, and is provided hereinbelow with reference to the sequence listing part.

[16853] GAM1213 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16854] An enzyme complex designated DICER COMPLEX, dices the GAM1213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1213 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1213 RNA is designated SEQ ID:3792, and is provided hereinbelow with reference to the sequence listing part.

[16855] GAM1213 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1213 target RNA, herein designated GAM TARGET RNA. GAM1213 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16856] GAM1213 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1213 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1213 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1213 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1213 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16857] The complementary binding of GAM1213 RNA, herein designated GAM RNA, to target binding sites on GAM1213 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1213 target RNA, herein designated GAM TARGET RNA, into GAM1213 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16858] It is appreciated that GAM1213 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1213 target genes. The mRNA of each one of this plurality of GAM1213 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1213 RNA, herein designated GAM RNA, and which when bound by GAM1213 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1213 target proteins.

[16859] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1213 gene, herein designated GAM GENE, on one or more GAM1213 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16860] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1213 correlate with, and may be deduced from, the identity of the target

genes which GAM1213 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16861] Nucleotide sequences of the GAM1213 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1213 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1213 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1213 are further described hereinbelow with reference to Table 1.

[16862] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1213 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16863] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1214 (GAM1214) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16864] GAM1214 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1214 was detected is described hereinabove with reference to Figs. 2-8.

[16865] GAM1214 gene, herein designated GAM GENE, and GAM1214 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16866] GAM1214 gene, herein designated GAM GENE, encodes a GAM1214 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1214 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1214 precursor RNA is designated SEQ ID:1191, and is provided hereinbelow with reference to the sequence listing part.

[16867] GAM1214 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16868] An enzyme complex designated DICER COMPLEX, dices the GAM1214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1214 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1214 RNA is designated SEQ ID:3793, and is provided

hereinbelow with reference to the sequence listing part.

[16869] GAM1214 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1214 target RNA, herein designated GAM TARGET RNA. GAM1214 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16870] GAM1214 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1214 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1214 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1214 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1214 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16871] The complementary binding of GAM1214 RNA, herein designated GAM RNA, to target binding sites on GAM1214 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1214 target RNA, herein designated GAM TARGET RNA, into GAM1214 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16872] It is appreciated that GAM1214 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1214 target genes. The mRNA of each one of this plurality of GAM1214 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1214 RNA, herein designated GAM RNA, and which when bound by GAM1214 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1214 target proteins.

[16873] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1214 gene, herein designated GAM GENE, on one or more GAM1214 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16874] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1214 correlate with, and may be deduced from, the identity of the target genes which GAM1214 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16875] Nucleotide sequences of the GAM1214 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1214 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1214 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1214 are further described hereinbelow with reference to Table 1.

[16876] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1214 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16877] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1215 (GAM1215) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16878] GAM1215 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1215 was detected is described hereinabove with reference to Figs. 2-8.

[16879] GAM1215 gene, herein designated GAM GENE, and GAM1215 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16880] GAM1215 gene, herein designated GAM GENE, encodes a GAM1215 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1215 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1215 precursor RNA is designated SEQ ID:1192, and is provided hereinbelow with reference to the sequence listing part.

[16881] GAM1215 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16882] An enzyme complex designated DICER COMPLEX, dices the GAM1215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1215 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1215 RNA is designated SEQ ID:3794, and is provided hereinbelow with reference to the sequence listing part.

[16883] GAM1215 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1215 target RNA, herein designated GAM TARGET RNA. GAM1215 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16884] GAM1215 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1215 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1215 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1215 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1215 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16885] The complementary binding of GAM1215 RNA, herein designated GAM RNA, to target binding sites on GAM1215 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1215 target RNA, herein designated GAM TARGET RNA, into GAM1215 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16886] It is appreciated that GAM1215 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1215 target genes. The mRNA of each one of this plurality of GAM1215 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1215 RNA, herein designated GAM RNA, and which when bound by GAM1215 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1215 target proteins.

[16887] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1215 gene, herein designated GAM GENE, on one or more GAM1215 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16888] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1215 correlate with, and may be deduced from, the identity of the target genes which GAM1215 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16889] Nucleotide sequences of the GAM1215 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1215 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1215 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1215 are further described hereinbelow with reference to Table 1.

[16890] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1215 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16891] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1216 (GAM1216) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16892] GAM1216 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1216 was detected is described hereinabove with reference to Figs. 2-8.

[16893] GAM1216 gene, herein designated GAM GENE, and GAM1216 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16894] GAM1216 gene, herein designated GAM GENE, encodes a GAM1216 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1216 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1216 precursor RNA is designated SEQ ID:1193, and is provided hereinbelow with reference to the sequence listing part.

[16895] GAM1216 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16896] An enzyme complex designated DICER COMPLEX, dices the GAM1216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1216 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1216 RNA is designated SEQ ID:3795, and is provided hereinbelow with reference to the sequence listing part.

[16897] GAM1216 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1216 target RNA, herein designated GAM TARGET RNA. GAM1216 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16898] GAM1216 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1216 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1216 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1216 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1216 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16899] The complementary binding of GAM1216 RNA, herein designated GAM RNA, to target binding sites on GAM1216 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1216 target RNA, herein designated GAM TARGET RNA, into GAM1216 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16900] It is appreciated that GAM1216 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1216 target genes. The mRNA of each one of this plurality of GAM1216 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1216 RNA, herein designated GAM RNA, and which when bound by GAM1216 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1216 target proteins.

[16901] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1216 gene, herein designated GAM GENE, on one or more GAM1216 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16902] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1216 correlate with, and may be deduced from, the identity of the target genes which GAM1216 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16903] Nucleotide sequences of the GAM1216 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1216 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1216 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1216 are further described hereinbelow with reference to Table 1.

[16904] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1216 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16905] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1217 (GAM1217) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16906] GAM1217 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1217 was detected is described hereinabove with reference to Figs. 2-8.

[16907] GAM1217 gene, herein designated GAM GENE, and GAM1217 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16908] GAM1217 gene, herein designated GAM GENE, encodes a GAM1217 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1217 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1217 precursor RNA is designated SEQ ID:1194, and is provided hereinbelow with reference to the sequence listing part.

[16909] GAM1217 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16910] An enzyme complex designated DICER COMPLEX, dices the GAM1217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1217 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1217 RNA is designated SEQ ID:3796, and is provided hereinbelow with reference to the sequence listing part.

[16911] GAM1217 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1217 target RNA, herein designated GAM TARGET RNA. GAM1217 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16912] GAM1217 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1217 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1217 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1217 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1217 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16913] The complementary binding of GAM1217 RNA, herein designated GAM RNA, to target binding sites on GAM1217 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1217 target RNA, herein designated GAM TARGET RNA, into GAM1217 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16914] It is appreciated that GAM1217 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1217 target genes. The mRNA of each one of this plurality of GAM1217 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1217 RNA, herein designated GAM RNA, and which when bound by GAM1217 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1217 target proteins.

[16915] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1217 gene, herein designated GAM GENE, on one or more GAM1217 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16916] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1217 correlate with, and may be deduced from, the identity of the target genes which GAM1217 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16917] Nucleotide sequences of the GAM1217 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1217 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1217 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1217 are further described hereinbelow with reference to Table 1.

[16918] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1217 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16919] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1218 (GAM1218) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16920] GAM1218 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1218 was detected is described hereinabove with reference to Figs. 2-8.

[16921] GAM1218 gene, herein designated GAM GENE, and GAM1218 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16922] GAM1218 gene, herein designated GAM GENE, encodes a GAM1218 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1218 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1218 precursor RNA is designated SEQ ID:1195, and is provided hereinbelow with reference to the sequence listing part.

[16923] GAM1218 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16924] An enzyme complex designated DICER COMPLEX, dices the GAM1218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1218 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1218 RNA is designated SEQ ID:3797, and is provided hereinbelow with reference to the sequence listing part.

[16925] GAM1218 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1218 target RNA, herein designated GAM TARGET RNA. GAM1218 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16926] GAM1218 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1218 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1218 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1218 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1218 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16927] The complementary binding of GAM1218 RNA, herein designated GAM RNA, to target binding sites on GAM1218 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1218 target RNA, herein designated GAM TARGET RNA, into GAM1218 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16928] It is appreciated that GAM1218 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1218 target genes. The

mRNA of each one of this plurality of GAM1218 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1218 RNA, herein designated GAM RNA, and which when bound by GAM1218 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1218 target proteins.

[16929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1218 gene, herein designated GAM GENE, on one or more GAM1218 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16930] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1218 correlate with, and may be deduced from, the identity of the target genes which GAM1218 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16931] Nucleotide sequences of the GAM1218 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1218 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1218 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1218 are further described hereinbelow with reference to Table 1.

[16932] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1218 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16933] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1219 (GAM1219) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16934] GAM1219 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1219 was detected is described hereinabove with reference to Figs. 2-8.

[16935] GAM1219 gene, herein designated GAM GENE, and GAM1219 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16936] GAM1219 gene, herein designated GAM GENE, encodes a GAM1219 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1219 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1219 precursor RNA is designated SEQ ID:1196, and is provided hereinbelow with reference to the sequence listing part.

[16937] GAM1219 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1219 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16938] An enzyme complex designated DICER COMPLEX, dices the GAM1219 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1219 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1219 RNA is designated SEQ ID:3798, and is provided hereinbelow with reference to the sequence listing part.

[16939] GAM1219 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1219 target RNA, herein designated GAM TARGET RNA. GAM1219 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16940] GAM1219 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1219 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1219 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1219 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1219 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16941] The complementary binding of GAM1219 RNA, herein designated GAM RNA, to target binding sites on GAM1219 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1219 target RNA, herein designated GAM TARGET RNA, into GAM1219 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16942] It is appreciated that GAM1219 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1219 target genes. The mRNA of each one of this plurality of GAM1219 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1219 RNA, herein designated GAM RNA, and which when bound by GAM1219 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1219 target proteins.

[16943] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1219 gene, herein designated GAM GENE, on one or more GAM1219 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16944] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1219 correlate with, and may be deduced from, the identity of the target

genes which GAM1219 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16945] Nucleotide sequences of the GAM1219 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1219 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1219 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1219 are further described hereinbelow with reference to Table 1.

[16946] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1219 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16947] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1220 (GAM1220) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16948] GAM1220 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1220 was detected is described hereinabove with reference to Figs. 2-8.

[16949] GAM1220 gene, herein designated GAM GENE, and GAM1220 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[16950] GAM1220 gene, herein designated GAM GENE, encodes a GAM1220 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1220 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1220 precursor RNA is designated SEQ ID:1197, and is provided hereinbelow with reference to the sequence listing part.

[16951] GAM1220 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16952] An enzyme complex designated DICER COMPLEX, dices the GAM1220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1220 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1220 RNA is designated SEQ ID:3801, and is provided

hereinbelow with reference to the sequence listing part.

[16953] GAM1220 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1220 target RNA, herein designated GAM TARGET RNA. GAM1220 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16954] GAM1220 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1220 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1220 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1220 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1220 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16955] The complementary binding of GAM1220 RNA, herein designated GAM RNA, to target binding sites on GAM1220 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1220 target RNA, herein designated GAM TARGET RNA, into GAM1220 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16956] It is appreciated that GAM1220 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1220 target genes. The mRNA of each one of this plurality of GAM1220 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1220 RNA, herein designated GAM RNA, and which when bound by GAM1220 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1220 target proteins.

[16957] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1220 gene, herein designated GAM GENE, on one or more GAM1220 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16958] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1220 correlate with, and may be deduced from, the identity of the target genes which GAM1220 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16959] Nucleotide sequences of the GAM1220 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1220 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1220 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1220 are further described hereinbelow with reference to Table 1.

[16960] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1220 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16961] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1221 (GAM1221) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16962] GAM1221 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1221 was detected is described hereinabove with reference to Figs. 2-8.

[16963] GAM1221 gene, herein designated GAM GENE, and GAM1221 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16964] GAM1221 gene, herein designated GAM GENE, encodes a GAM1221 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1221 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1221 precursor RNA is designated SEQ ID:1198, and is provided hereinbelow with reference to the sequence listing part.

[16965] GAM1221 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16966] An enzyme complex designated DICER COMPLEX, dices the GAM1221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1221 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1221 RNA is designated SEQ ID:3800, and is provided hereinbelow with reference to the sequence listing part.

[16967] GAM1221 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1221 target RNA, herein designated GAM TARGET RNA. GAM1221 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16968] GAM1221 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1221 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1221 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1221 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1221 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16969] The complementary binding of GAM1221 RNA, herein designated GAM RNA, to target binding sites on GAM1221 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1221 target RNA, herein designated GAM TARGET RNA, into GAM1221 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16970] It is appreciated that GAM1221 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1221 target genes. The mRNA of each one of this plurality of GAM1221 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1221 RNA, herein designated GAM RNA, and which when bound by GAM1221 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1221 target proteins.

[16971] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1221 gene, herein designated GAM GENE, on one or more GAM1221 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16972] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1221 correlate with, and may be deduced from, the identity of the target genes which GAM1221 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16973] Nucleotide sequences of the GAM1221 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1221 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1221 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1221 are further described hereinbelow with reference to Table 1.

[16974] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1221 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[16975] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1222 (GAM1222) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16976] GAM1222 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1222 was detected is described hereinabove with reference to Figs. 2-8.

[16977] GAM1222 gene, herein designated GAM GENE, and GAM1222 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16978] GAM1222 gene, herein designated GAM GENE, encodes a GAM1222 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1222 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1222 precursor RNA is designated SEQ ID:1199, and is provided hereinbelow with reference to the sequence listing part.

[16979] GAM1222 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16980] An enzyme complex designated DICER COMPLEX, dices the GAM1222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1222 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1222 RNA is designated SEQ ID:3799, and is provided hereinbelow with reference to the sequence listing part.

[16981] GAM1222 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1222 target RNA, herein designated GAM TARGET RNA. GAM1222 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16982] GAM1222 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1222 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1222 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1222 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1222 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16983] The complementary binding of GAM1222 RNA, herein designated GAM RNA, to target binding sites on GAM1222 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1222 target RNA, herein designated GAM TARGET RNA, into GAM1222 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16984] It is appreciated that GAM1222 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1222 target genes. The mRNA of each one of this plurality of GAM1222 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1222 RNA, herein designated GAM RNA, and which when bound by GAM1222 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1222 target proteins.

[16985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1222 gene, herein designated GAM GENE, on one or more GAM1222 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16986] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1222 correlate with, and may be deduced from, the identity of the target genes which GAM1222 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16987] Nucleotide sequences of the GAM1222 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1222 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1222 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1222 are further described hereinbelow with reference to Table 1.

[16988] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1222 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[16989] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1223 (GAM1223) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16990] GAM1223 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1223 was detected is described hereinabove with reference to Figs. 2-8.

[16991] GAM1223 gene, herein designated GAM GENE, and GAM1223 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[16992] GAM1223 gene, herein designated GAM GENE, encodes a GAM1223 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1223 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1223 precursor RNA is designated SEQ ID:1200, and is provided hereinbelow with reference to the sequence listing part.

[16993] GAM1223 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16994] An enzyme complex designated DICER COMPLEX, dices the GAM1223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1223 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1223 RNA is designated SEQ ID:3803, and is provided hereinbelow with reference to the sequence listing part.

[16995] GAM1223 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1223 target RNA, herein designated GAM TARGET RNA. GAM1223 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16996] GAM1223 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1223 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1223 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1223 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1223 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16997] The complementary binding of GAM1223 RNA, herein designated GAM RNA, to target binding sites on GAM1223 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1223 target RNA, herein designated GAM TARGET RNA, into GAM1223 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16998] It is appreciated that GAM1223 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1223 target genes. The mRNA of each one of this plurality of GAM1223 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1223 RNA, herein designated GAM RNA, and which when bound by GAM1223 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1223 target proteins.

[16999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1223 gene, herein designated GAM GENE, on one or more GAM1223 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17000] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1223 correlate with, and may be deduced from, the identity of the target genes which GAM1223 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17001] Nucleotide sequences of the GAM1223 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1223 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1223 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1223 are further described hereinbelow with reference to Table 1.

[17002] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1223 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17003]

[17004] Fig. 8 further provides a conceptual description of a novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1224 (GAM1224) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17005] GAM1224 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1224 was detected is described hereinabove with reference to Figs. 2-8.

[17006] GAM1224 gene, herein designated GAM GENE, and GAM1224 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17007] GAM1224 gene, herein designated GAM GENE, encodes a GAM1224 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1224 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1224 precursor RNA is designated SEQ ID:1201, and is provided

hereinbelow with reference to the sequence listing part.

[17008] GAM1224 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17009] An enzyme complex designated DICER COMPLEX, dices the GAM1224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1224 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1224 RNA is designated SEQ ID:3802, and is provided hereinbelow with reference to the sequence listing part.

[17010] GAM1224 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1224 target RNA, herein designated GAM TARGET RNA. GAM1224 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[17011] GAM1224 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1224 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1224 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1224 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1224 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17012] The complementary binding of GAM1224 RNA, herein designated GAM RNA, to target binding sites on GAM1224 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1224 target RNA, herein designated GAM TARGET RNA, into GAM1224 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17013] It is appreciated that GAM1224 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1224 target genes. The mRNA of each one of this plurality of GAM1224 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1224 RNA, herein designated GAM RNA, and which when bound by GAM1224 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1224 target proteins.

[17014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1224 gene, herein designated GAM GENE, on one or more GAM1224 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17015] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1224 correlate with, and may be deduced from, the identity of the target genes which GAM1224 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17016] Nucleotide sequences of the GAM1224 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1224 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1224 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1224 are further described hereinbelow with reference to Table 1.

[17017] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1224 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17018] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1225 (GAM1225) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17019] GAM1225 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1225 was detected is described hereinabove with reference to Figs. 2-8.

[17020] GAM1225 gene, herein designated GAM GENE, and GAM1225 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17021] GAM1225 gene, herein designated GAM GENE, encodes a GAM1225

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1225 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1225 precursor RNA is designated SEQ ID:1202, and is provided hereinbelow with reference to the sequence listing part.

[17022] GAM1225 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17023] An enzyme complex designated DICER COMPLEX, dices the GAM1225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1225 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1225 RNA is designated SEQ ID:3804, and is provided hereinbelow with reference to the sequence listing part.

[17024] GAM1225 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM1225 target RNA, herein designated GAM TARGET RNA. GAM1225 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17025] GAM1225 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1225 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1225 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1225 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1225 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17026] The complementary binding of GAM1225 RNA, herein designated GAM RNA, to target binding sites on GAM1225 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of GAM1225 target RNA, herein designated GAM TARGET RNA, into GAM1225 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17027] It is appreciated that GAM1225 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1225 target genes. The mRNA of each one of this plurality of GAM1225 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1225 RNA, herein designated GAM RNA, and which when bound by GAM1225 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1225 target proteins.

[17028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1225 gene, herein designated GAM GENE, on one or more GAM1225 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17029] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1225 correlate with, and may be deduced from, the identity of the target genes which GAM1225 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17030] Nucleotide sequences of the GAM1225 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1225 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1225 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1225 are further described hereinbelow with reference to Table 1.

[17031] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1225 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17032] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1226 (GAM1226) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17033] GAM1226 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1226 was detected is described hereinabove with reference to Figs. 2-8.

[17034] GAM1226 gene, herein designated GAM GENE, and GAM1226 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17035] GAM1226 gene, herein designated GAM GENE, encodes a GAM1226 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1226 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1226 precursor RNA is designated SEQ ID:1203, and is provided hereinbelow with reference to the sequence listing part.

[17036] GAM1226 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17037] An enzyme complex designated DICER COMPLEX, dices the GAM1226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1226 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1226 RNA is designated SEQ ID:3805, and is provided hereinbelow with reference to the sequence listing part.

[17038] GAM1226 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1226 target RNA, herein designated GAM TARGET RNA. GAM1226 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17039] GAM1226 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1226 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1226 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1226 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1226 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[17040] The complementary binding of GAM1226 RNA, herein designated GAM RNA, to target binding sites on GAM1226 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1226 target RNA, herein designated GAM TARGET RNA, into GAM1226 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17041] It is appreciated that GAM1226 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1226 target genes. The mRNA of each one of this plurality of GAM1226 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1226 RNA, herein designated GAM RNA, and which when bound by GAM1226 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1226 target proteins.

[17042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1226 gene, herein designated GAM GENE, on one or more GAM1226 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17043] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1226 correlate with, and may be deduced from, the identity of the target genes which GAM1226 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17044] Nucleotide sequences of the GAM1226 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1226 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1226 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1226 are further described hereinbelow with reference to Table 1.

[17045] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1226 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17046] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1227 (GAM1227) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17047] GAM1227 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1227 was detected is described hereinabove with reference to Figs. 2-8.

[17048] GAM1227 gene, herein designated GAM GENE, and GAM1227 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17049] GAM1227 gene, herein designated GAM GENE, encodes a GAM1227 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1227 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1227 precursor RNA is designated SEQ ID:1204, and is provided hereinbelow with reference to the sequence listing part.

[17050] GAM1227 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17051] An enzyme complex designated DICER COMPLEX, dices the GAM1227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1227 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1227 RNA is designated SEQ ID:3807, and is provided hereinbelow with reference to the sequence listing part.

[17052] GAM1227 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1227 target RNA, herein designated GAM TARGET RNA. GAM1227 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17053] GAM1227 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1227 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1227 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1227 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1227 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17054] The complementary binding of GAM1227 RNA, herein designated GAM RNA, to target binding sites on GAM1227 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1227 target RNA, herein designated GAM TARGET RNA, into GAM1227 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17055] It is appreciated that GAM1227 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1227 target genes. The mRNA of each one of this plurality of GAM1227 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1227 RNA, herein designated GAM RNA, and which when bound by GAM1227 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1227 target proteins.

[17056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1227 gene, herein designated GAM GENE, on one or more GAM1227 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17057] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1227 correlate with, and may be deduced from, the identity of the target genes which GAM1227 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17058] Nucleotide sequences of the GAM1227 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1227 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1227 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1227 are further described hereinbelow with reference to Table 1.

[17059] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1227 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17060] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1228 (GAM1228) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.
